Interactive comment on “Evaluation of ECMWF water vapour analyses by airborne differential absorption lidar measurements: a case study between Brasil and Europe” by H. Flentje et al.

H. Flentje et al.

Received and published: 23 July 2007

We thank the reviewer for the very thoughtful and helpful comments which will be taken into account in the revised version of the manuscript.

Particularly, this review encourages us to elaborate somewhat more on important details which are necessary for the appreciation of our results also with respect to previous and other ongoing work. It seems that we cut the text a bit too much (before submission) in order to stay as close as possible to the main statements of the study, e.g. for the discussion of the air-mass/trajectory and the humidity forecasting system sections. A number of good items were raised to be clarified or thought about and we are very grateful for this.
