

Interactive comment on “Validation of ACE-FTS v2.2 methane profiles from the upper troposphere to lower mesosphere” by M. De Mazière et al.

Anonymous Referee #2

Received and published: 25 January 2008

I thought this was a solid paper that is a valuable piece of work for those in the CH₄/remote sensing communities.

The authors might comment more on the spectroscopy in the microwindows used and any biases resulting from this.

The authors very clearly stated the basis for comparison between different platforms (ie, what observations were considered coincident), and had made good use of the available data.
