

## ***Interactive comment on “Extended observations of volcanic SO<sub>2</sub> and sulfate aerosol in the stratosphere” by S. A. Carn et al.***

### **Anonymous Referee #2**

Received and published: 30 March 2007

This manuscript provides interesting first data of monitoring SO<sub>2</sub> emitted from moderate volcanic eruptions over long enough time to gain information on the conversion to SO<sub>4</sub>. We may expect that from now on the input of S species into the stratosphere will be monitored more accurately. The text is well written, clear and interesting and shows the potential of A-Train satellites. I suggest publication with only minor revisions.

Only few critical remarks are necessary: 1. VEI is not at all a useful index when SO<sub>2</sub> emissions are of concern. 2. I do not quite buy the links with proposed geo-engineering in the conclusions. Seems to me that is a bit of a long shoot. It should be enough saying that we now have the means to much better monitor the injection of S into the stratosphere, the injection height, conversion rate etc. 3. Volcanic eruptions do not trigger Climate Change, but rather climate anomalies.
