

Interactive comment on “Probing ETEX-II data set with inverse modelling” by M. Krysta et al.

Anonymous Referee #2

Received and published: 22 February 2008

I have read with great interest the paper which you sent me. I think it is rather interesting in so far since it opens for the first time the possibility that there might have been something wrong with the measurements. This possibility was earlier absolutely excluded. Anyway, it is worthwhile to publish this interesting piece of work since it may open some new clues why ETEX II went so wrong.
