There are two papers that report high resolution methane observations in the upper tropical troposphere that could be compared with the IASI data. They are J Geophys Res 109:D05310, doi: 10.1029/2003JD003942 (2004) and J Geophys Res 111:D13304, doi:10.1029/2005JD006513. The data are continuous, not point observations and have variability that should be useful.
