Authors,

I was contacted by one of the referees who wishes to anonymously ask a technical question before proceeding with the review:

It is not clear what sizes of soil particles analyzed for INPs. Page 3, Line 19 mentions sieving soil at the 0.5 mm level, but as written, this statement refers only to the CHN analysis. Can you clarify the size range of material used for INP analysis and how this was achieved?

Thank you.

Alex Huffman
