Table S1. Meteorological information near the sites from May to August in each year

\* Wind speeds (unit: m/s) were indicated by color bars

Fig.S1. Comparison of ammonia concentrations measured by replicate passive samples. The error bars represent the relative standard deviation of 8.9 % calculated from all 288 pooled replicate samples.

Fig.S2. Comparison of NH<sub>3</sub> concentrations from the Radiello passive samplers and URG samplers.

Fig.S3. (a) NH<sub>3</sub> concentration versus temperature at 10 m and 300 m and (b) correlation coefficients between NH<sub>3</sub> concentration and temperatures at different heights of the BAO tower.

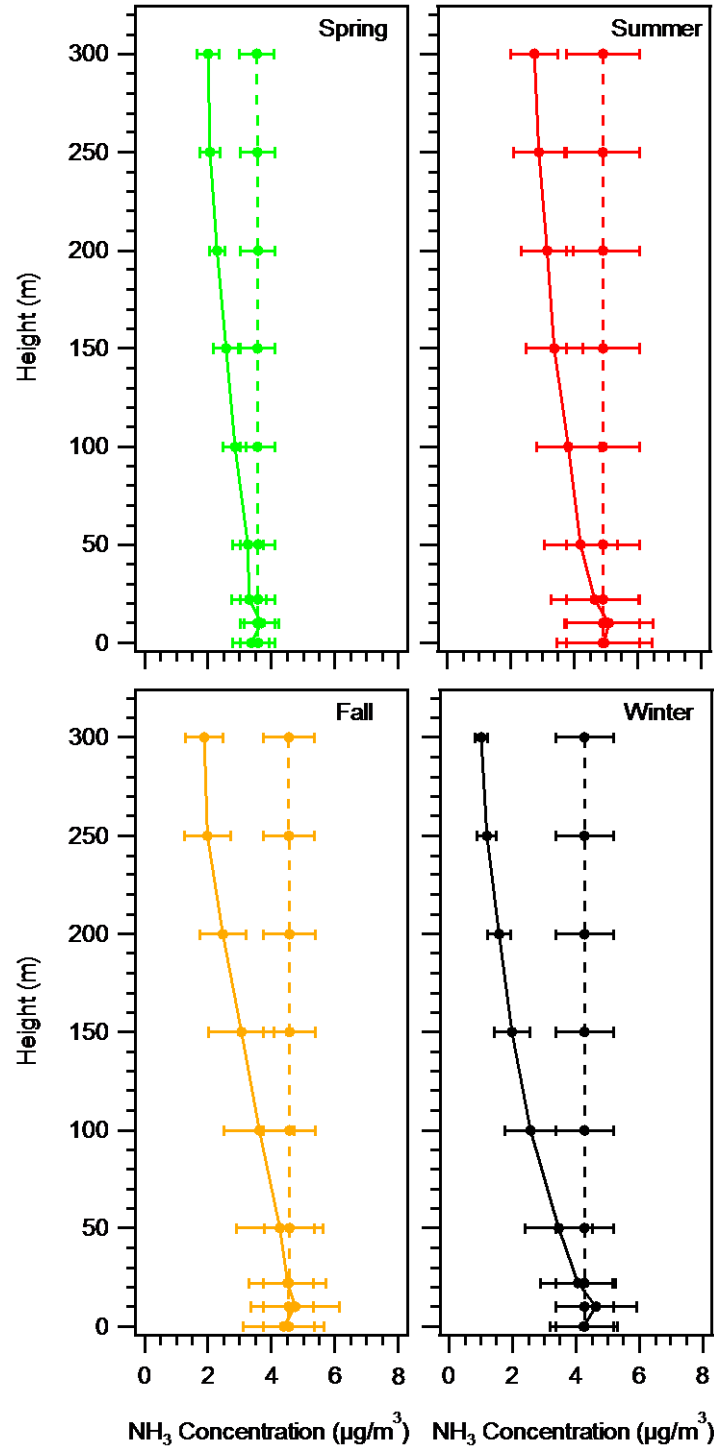

Fig.S4. Seasonal average vertical profiles of NH<sub>3</sub> measured at the BAO tower (solid line) and ISORROPIA II model results (dashed line) in 2012. The x-error bars represent the relative standard deviation of NH<sub>3</sub> concentrations.

Fig.S5. Satellite image of the wildfire plume over northeastern Colorado caught by the Moderate Resolution Imaging Spectroradiometer (MODIS) (Image downloaded at <http://loatec.univ-lille1.fr/TerreEtCiel/module.php?lang=us>). The FC\_W site is indicated by a yellow star.

Fig.S6. The 36-km horizontal grid resolution outer domain, represented by the extent of the larger box, covers the contiguous United States, northern Mexico, and southern Canada. The 12-km domain includes states surrounding Colorado. The inner 4-km domain extends over Colorado, Utah, Wyoming and portions of surrounding states.
