Dear Dr. Merched Azzi Thank you so much for your evaluation and very helpful suggestions. We are indeed doing more thorough analyses on inorganic and organic N components and their isotopes (only  $\delta^{15}\text{N}$ ,  $\delta^{18}\text{O}$ ,  $\Delta^{17}\text{O}$  of nitrate so far) in a wider range of PM<sub>2.5</sub> samples collected at Beijing area. There have been several works on carbon isotopes ( $\delta^{13}\text{C}$  and or  $\Delta^{14}\text{C}$ ) of TC, EC, organic C compounds of aerosols in China, which can be involved when necessary to improve N source apportionment.
