¹number of fires in the radius of 200 km from the sampling station

^{2,3}concentrations were averaged for filter sampling intervals; the instrument detection limit for benzene and NO_y were below 0.02 ppbv and 0.05ppb, respectively.

49 Figure SI1. 72 h back air mass history ('footprints') arriving at the T3 station for the periods
 50 of the analysed filters. Warmer colours indicate a greater probability of a particle passing
 51 near the surface in a grid box. The sampling site is indicated by a cross symbol. Manaus and
 52 Manacapuru cities are indicated as triangles (far right and below of the sampling site,
 53 respectively).

54

Figure SI2. RH at the T3 sampling site during (a) IOP1 and (b) IOP2. The arrows indicate sample collection periods. ARM data source.

Figure SI3. Correlation between benzene and CO average concentrations during IOP1 and IOP2 sampling periods at sampling T3 site. The data was averaged for aerosol filter sampling intervals.

64

65 Figure SI4. Average CO concentration during IOP1 and IOP2 sampling periods at T3 site.

66 Each data point corresponds to the average concentration within the sampling interval.

68

69 Figure SI5. H/C vs m/z plot for CHON containing formulae in the samples from the periods
 70 with (a) low (b) moderately high and (c) very high incidents of fires. The marker areas reflect
 71 relative ion abundance in the sample. The colour code shows aromaticity equivalent (X_c) in
 72 the individual molecular formula. Molecular formulae with $X_c < 2.5$ are shown as grey
 73 markers.

74

75

Figure SI6. H/C vs m/z plot for CHO containing compounds in the samples from the periods with (a) low (b) moderately high and (c) very high incidents of fires. The marker areas reflect relative ion abundance in the sample. The colour code shows aromaticity equivalent (X_c) in the individual molecular formula. Molecular formulae with $X_c < 2.5$ are shown as grey markers.

Figure SI7. H/C vs m/z plot for CHON containing compounds in the samples from the periods with (a) low (b) moderately high and (c) very high incidents of fires. The marker areas reflect relative ion abundance in the sample. The colour code shows double bond equivalent (DBE) the individual molecular formula. Molecular formulae with DBE < 5 are shown as grey markers.
