## **1. Chemical transport models**

There are currently six global chemical transport models that include algorithms for the dry deposition of Hg: GRAHM, Environment Canada's Global/Regional Atmospheric Heavy Metal Model (Dastoor and Laroque, 2004); GEOS-Chem, the United States' Goddard Earth Observing System mercury model (Selin et al., 2007); ECHMERIT, a European global online model based on the Atmospheric General Circulation Model (*ECHAM5*) and a *MERcury* chemistry module, developed in Rende, *ITaly*, (Jung et al., 2009); GNAQPMS-Hg, the Asian Global Nested Air Quality Prediction Modelling System for Hg (Chen et al., 2015), GLEMONS, the Russian Global EMEP Multi-media Modelling System (Travnikov and Ilyin, 2009); and CTM-Hg, the United States' global Chemical Transport Model for Hg (Seigneur et al., 2004). A number of regional models also include dry deposition algorithms: CMAQ, the Community Multi-scale Air Quality model (Bullock and Brehme, 2002); WRF/Chem, the Weather Research and Forecasting model coupled with chemistry (Grell et al., 2005); TEAM, the North American Trace Elements Analysis Model (Pai et al., 1997); CAMx, the Comprehensive Air Quality Model with Extensions (de Foy et al., 2014); DEHM, the Danish Eulerian Hemispheric Model (Christensen, 1997; Christensen et al., 2004); REMSAD, the Regional Modeling System for Aerosols and Deposition (Bullock et al., 2008; 2009); CAM-Chem/Hg, the Community Atmospheric Model with mercury CAM-Chem/Hg (Lei et al., 2014); and ADOM, the Canadian-German Acid Deposition and Oxidants Model (Petersen et al., 2001). A summary of the algorithms for GEM, GOM, and PBM used by the global chemical transport models is provided in Table S1.
