Comments to a paper Biomass burning contribution to regional PM<sub>2.5</sub> during winter in the North China In present study, a more reliable source apportionment of PM<sub>2.5</sub> on the regional scale in the North China in winter is provided using PMF simulation and the radiocarbon measurements. It is consistent work performed on a good level. It looks like the title of the paper does not relate the content of the paper well. It announces Biomass burning contribution to regional PM<sub>2.5</sub> during winter in general in the North China while the work was done only on one site. If one site represents the whole North China?
