Received and published: 20 December 2017

The authors may wish to refer to recent work by Schroeder et al. (2017) doi: 10.1002/2017JD026781, who did a thorough analysis of the utility of column HCHO/NO₂ ratios to indicate surface O₃. Schroeder et al. found that column HCHO/NO₂ ratios are not effective for determining surface O₃ sensitivity, as the "transition" range is certainly larger than the range of 1-2 described in Duncan et al (2010), and larger than the 1.3-2.8 used in this work.
