Interactive comment on "Insight into Global Trends in Aerosol Composition over 2005–2015 Inferred from the OMI Ultraviolet Aerosol Index" *by* Melanie S. Hammer et al.

Anonymous Referee #2

The paper is appropriate for ACP. I have almost nothing to comment. However, the paper is rather lengthy, like a final report of a project. I can imagine that the information is very useful for many aerosol researchers, especially modelers.

However, if possible the results should be presented in a much more condensed form. Positive as well as negative trends are reported, and a large number of trends are found, at the end the reader is left a bit alone what the main conclusions, what the key messages are.
