

## Supplement

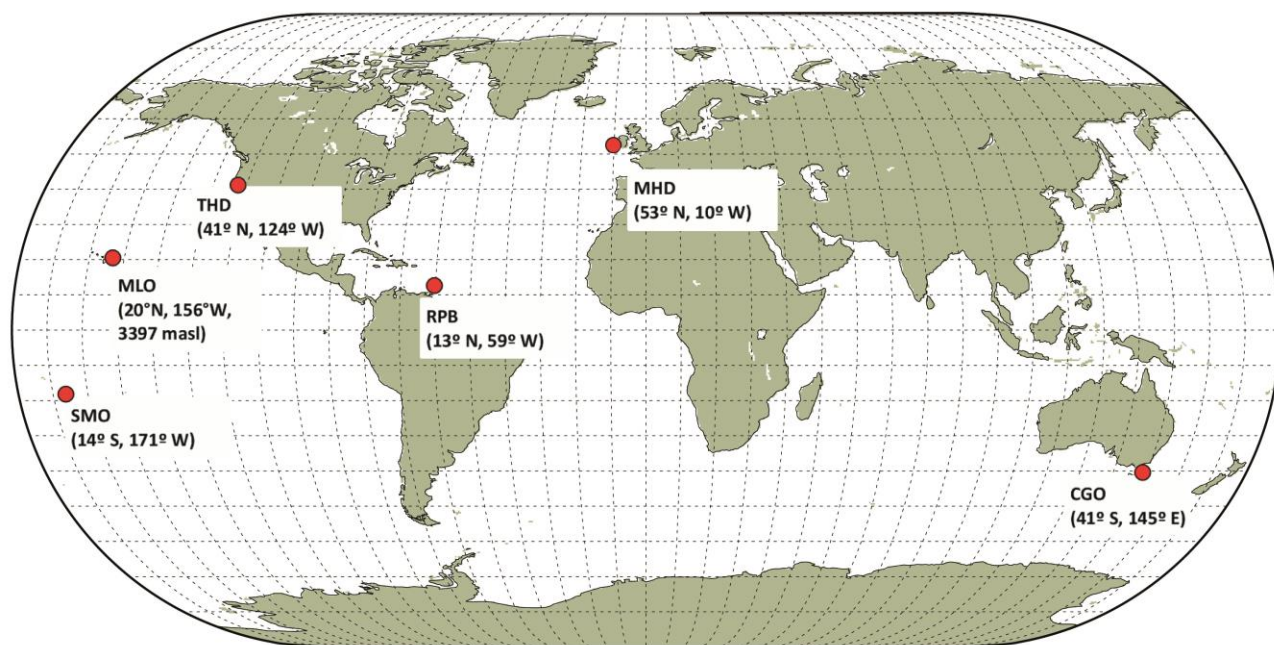

Figure S1: AGAGE/ NOAA stations

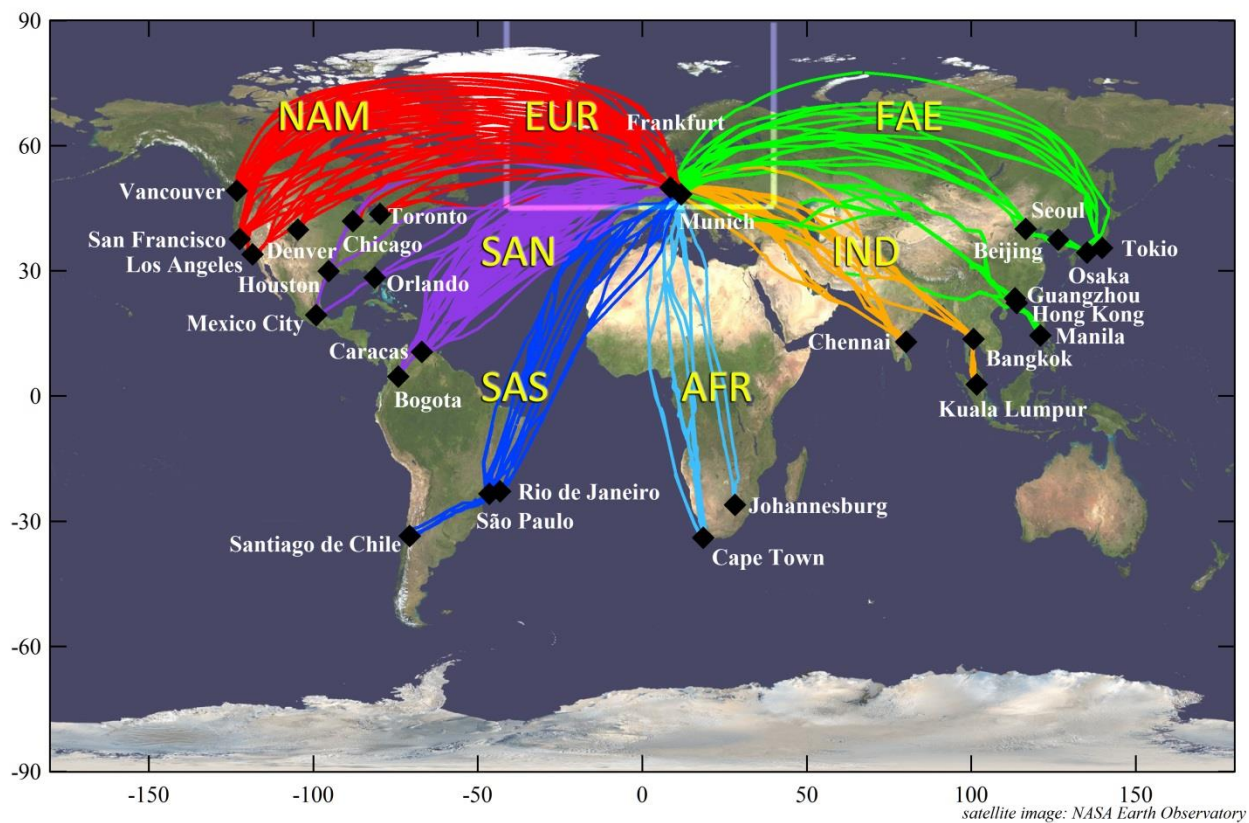

Figure S2: CARIBIC flights and destinations

Figure S3:

a: Zonal mean biomass burning CH<sub>4</sub> mixing-ratios in 1997 (scaled to 0 ... 1).

b: same, but for tropical rice paddy released CH<sub>4</sub> mixing-ratios.

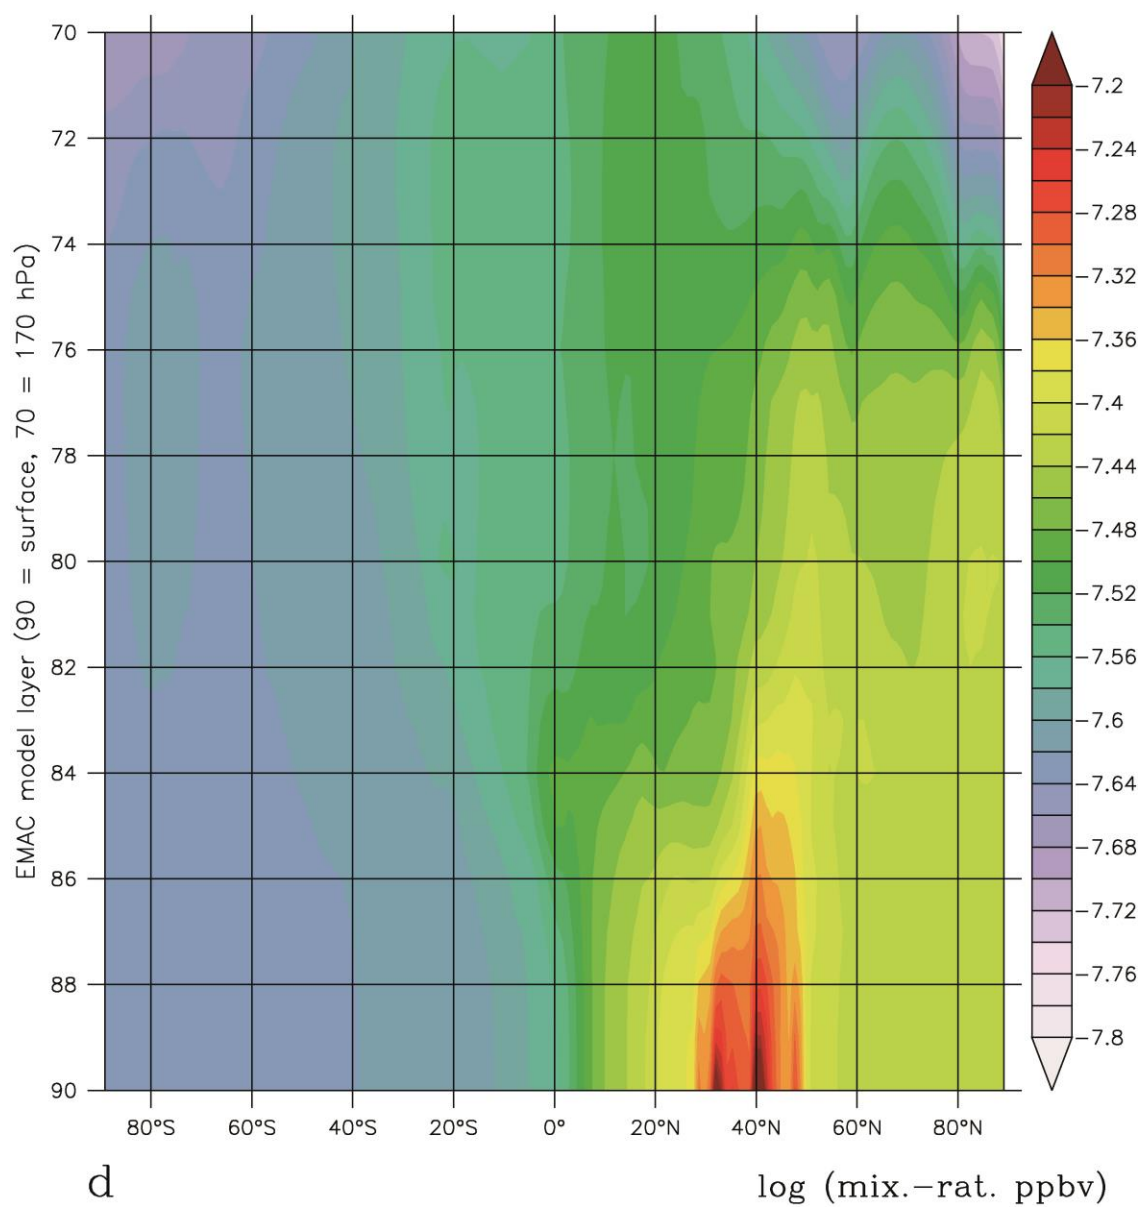

Figure S5:

a: Vertical methane mixing ratio distribution of tagged TRO emissions.

# CH<sub>4</sub> vert. profile

EMAC-SHA scenario, (120 W – 70 W) zonal mean, 23-MAR-2011

b: Same as c, but for SHA emissions.

Figure S6

a: EMAC calculated  $\text{CH}_4$ , including trend, and CARIBIC-2 observations 2007 through 2014.

b: same as Fig. 6a but resolved by flight regions.

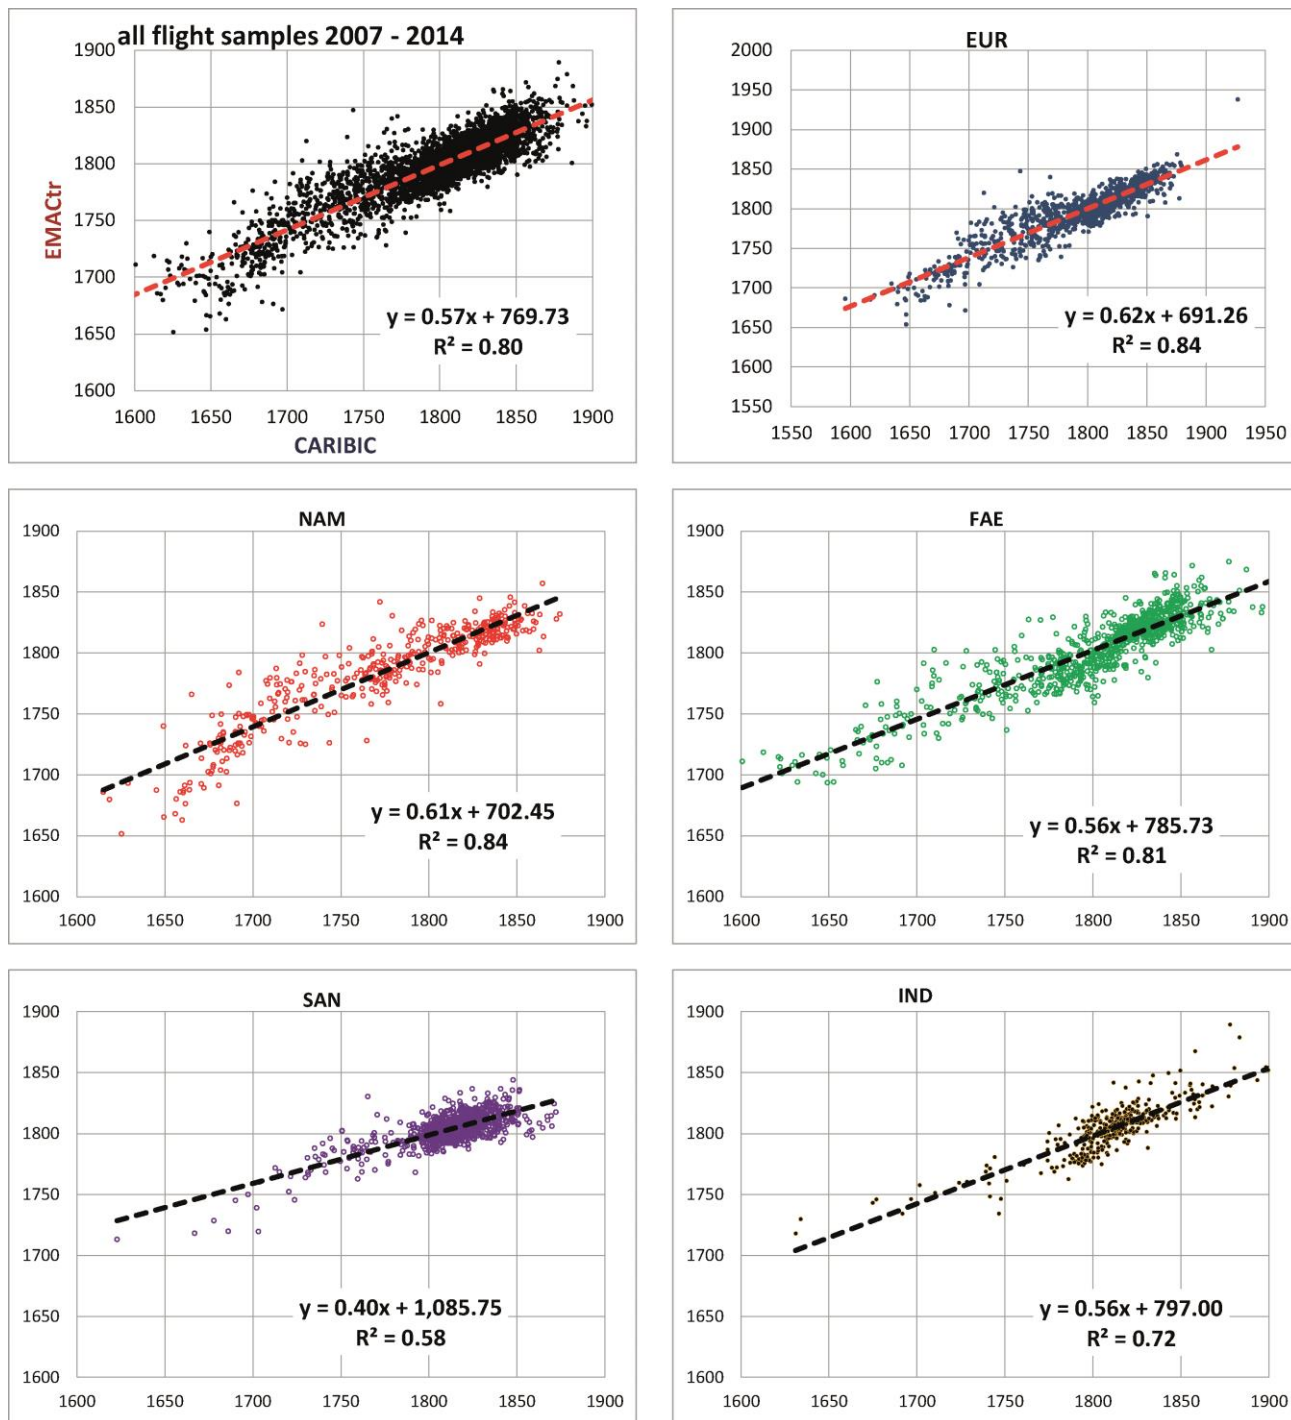

Figure S7: Linear regression between CARIBIC-2 samples and EMAC calculations for all trend period flights (2007 - 2014) and for flight regions with more than 300 samples.

Figure S8. Average CH<sub>4</sub> composition of all CARIBIC flight samples 1997 - 2006, compared to respective emissions.
