

Final reviewer comments on “Nanoparticle Growth by Particle Phase Chemistry”

I feel the authors have fully addressed all of my initial concerns about this manuscript. Firstly, the authors have done a more thorough job reporting on the prior work in this research area as well as pointing out the unique contributions made by their work. In addition, the authors have compared model results with experimental studies from their own laboratory. This has resulted in further insights on model performance as well as additionally providing some constraints on dimerization rates in growing nanoparticles.
