This comment is in response to a message sent by one of the referees. The referee made a mistake in one of his/her comment (see below). I encourage the authors to respond to this correction while the manuscript is undergoing a second round of reviews.

Original referee comment

8. Line 330-333. While levoglucosan is deliquescent, the ERH of AS was found to shift to HIGHER RH when the mass fraction of levoglucosan increases. This appears to be

C1

a contradiction to the deliquescent nature of levoglucosan. Any explanation?

This was meant to say NON-deliquescent. The intended question was

8. Line 330-333. While levoglucosan is non deliquescent, the ERH of AS was found to shift to HIGHER RH when the mass fraction of levoglucosan increases. This appears to be a contradiction to the Non deliquescent nature of levoglucosan. Any explanation?
