

Supplement to

A very limited role of tropospheric chlorine as a sink of the greenhouse gas methane

S. Gromov, C. A. M. Brenninkmeijer and P. Jöckel

Correspondence to: S. Gromov (sergey.gromov@mpic.de)

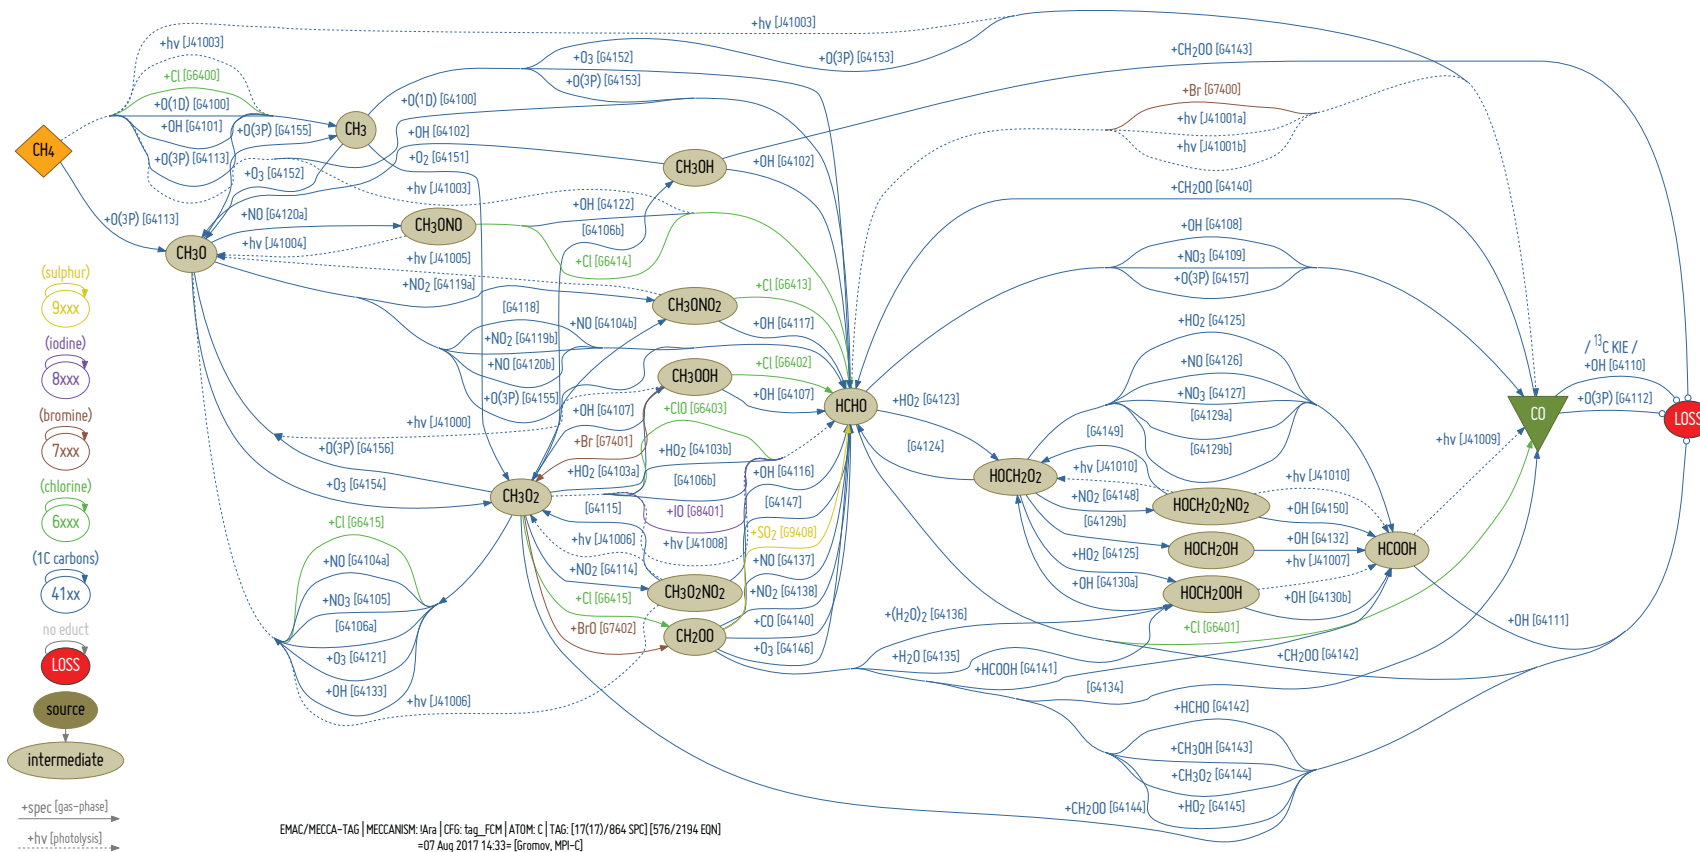

Fig. S1 Diagram of reaction pathways (following C exchanges) between CH₄ and CO as simulated in MECCA (the kinetic chemistry submodel used in EMAC, see Sect. 2.3 of the manuscript for details). Each arrow denotes a single gas-phase (solid line) or photolysis (dashed line) reaction; caption lists the reaction partner and label; colours refer to the chemical mechanism groups defined in MECCA. Pathways ending at the loss reservoir remove C from the CH₄ → CO conversion chain. Note that non-chemical removal of C from the system (e.g. dry/wet deposition of CH₃O₂, CH₃OH, HCHO, HCOOH intermediates) is not shown, however, simulated by the model. See Supplement to Lelieveld *et al.* (2016) (p. S18, <https://www.atmos-chem-phys.net/16/12477/2016/acp-16-12477-2016-supplement.pdf>) for the complete listing of the respective MECCA reaction mechanism.

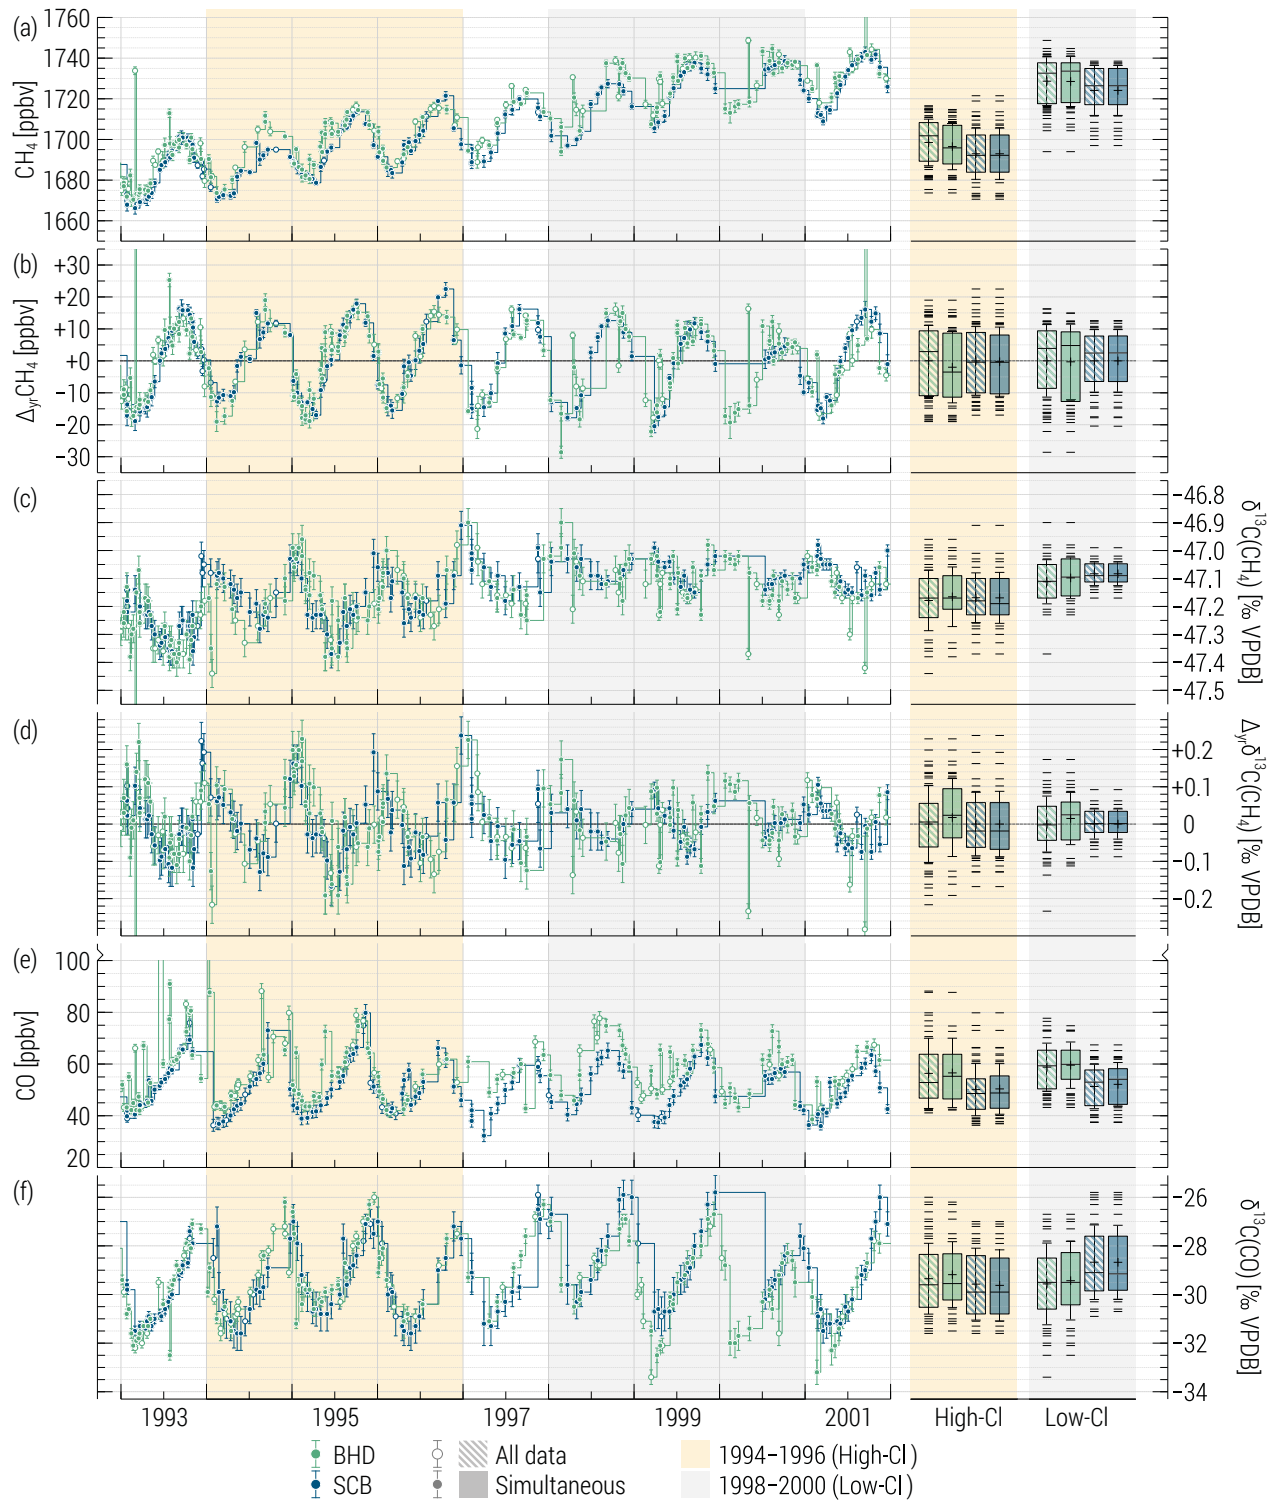

Fig. S2 Time series (left) and statistics (right, box-and-whisker plots) of the observations from Baring Head (BHD) and Scott Base (SCB) scrutinised in this study. Panels (a, c) present the mixing ratios and $\delta^{13}\text{C}$ of CH₄; panels (b, d) show anomalies with respect to the annual averages (denoted with “ Δ_{yr} ”). Panels (e, f) display the mixing ratios and $\delta^{13}\text{C}$ of CO. The number of samples in each subset is presented in the manuscript (Fig. 1, panel (g)). Shaded areas denote the ETSH MBL high-Cl (orange shaded) and low-Cl (grey shaded) periods hypothesised by A07 (see text for details). Step lines navigate through the entire time series at each station. Boxes and whiskers present the median/interquartile range and $\pm 1\sigma$ (of the population) of the selected data. Plus and minus symbols denote the averages and samples falling outside $\pm 1\sigma$, respectively. Solid symbols/boxes refer to the data when CH₄ and CO samples were taken simultaneously (up to 7 days apart); hollow symbols/hatched boxes refer to all data.

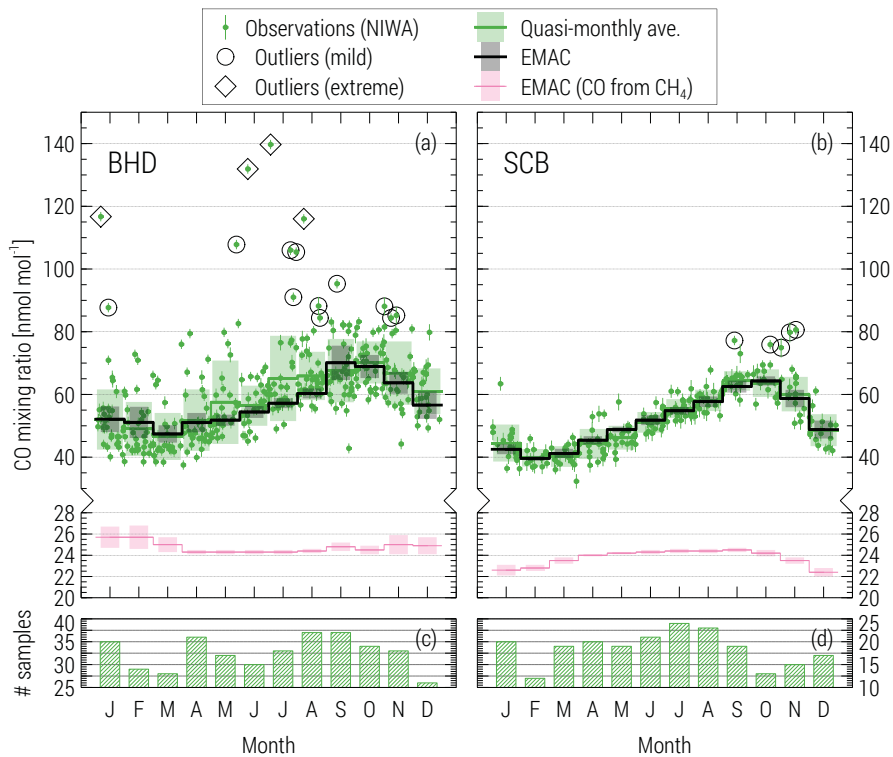

Fig. S3 Seasonal cycles CO mixing ratio at Baring Head (BHD, panel **a**) and Scott Base (SCB, panel **b**). Observations (entire data series plotted against day of year) are shown with symbols; circles and diamonds denote mild and extreme outliers (see Sect. 2.2 of the manuscript for details). Step lines refer to quasi-monthly averages derived from the observations (green) and from the EMAC model (1996–2005) for total CO (black) and its component derived from CH₄ oxidation (thin red line, lower scale). Vertical bars indicate measurement uncertainty (for observations) and $\pm 1\sigma$ (standard deviation of the subsample used for quasi-monthly averages). Panels (c, d) show the number of samples in observational data. Mind the breaks and different scales of the ordinate axes.

Table S1 Annual average CO- and CH₄-related integrals by domain simulated in EMAC for 1996–2005.
