

Interactive comment on “Volatile organic compounds at a rural site in Beijing: Influence of temporary emission control and wintertime heating” by W. Yang et al.

Anonymous Referee #3

Received and published: 5 June 2018

Household air pollution from burning biomass and coal for cooking foods and heating rooms has long been a major environmental problem. Previous studies suggested that the uncontrolled and inefficient combustion of solid fuels for heating in winter also contributed substantially to outdoor PM_{2.5}, BC, OC, SO₂ and NO_x in many regions, such as in the North China Plain (Liu et al., 2016, PNAS). The field observations at the rural site of Beijing in this study further demonstrated that the combustion of solid fuels for heating in winter made remarkable contribution to ambient volatile organic compounds (VOCs). The authors also took advantage of the temporary intervention measures for emission control during the APEC to evaluate the actual effect of the control measures on the ambient VOCs levels through reduction of the source contributions. parison between the heating and non-heating periods offered robust results indicating the influential emission from winter heating. Overall, the data quality of this manuscript is quite good, and the interpretation of the results is appropriate and convincing. Therefore, I strongly recommend publication of this manuscript. Majors: As stated above, an important finding of this study is that residential coal burning, especially during winter heating period, could be a major contributor to the ambient VOCs. Apart from the emission factors available for residential coal burning, is it possible for the authors to have the amounts of coals consumed in the residential sector especially during winter and give an in-depth explanation why this source could contribute substantially? The study suggests clean energy use in residential sector is vital for reducing VOCs in the heavily polluted winter. This aspect should be incorporated into the discussion or the conclusion part of the manuscript.

Minors: Although I am not a native English speaker, I would say that there is still room for improving English writing of the manuscript. The authors better find a native English speaker to check the English. Below is a list of changes that, I think, should be made: Line 33-34: Change “during wintertime severe haze events” to “during severe wintertime haze events ”; Line 35: Change “comparatively much less” to “not well”; Line 37: Change “inside” to “on” Line 37: add “the” before “University”; Line 38: Change “north-east” to “northeastern”; Line 39: Remove “that”; Line 39: Change “during” to “on”; Line 40: Add “the” before “air quality”; Line 41: Change “in” to “on”; Line 41: Remove “that”; Line 41: Change “since” to “on”; Line 42: Change “it is” to “this sample collection period provided”; Line 43: Remove “the” before “temporary” and before “wintertime”; Line 44, 45: Add “the” before “temporary”; Line 46: Change “about” to “approximately”; Line 47: Change “that” to “the values”; Line 46-48: Change “that of 23.41 ppb before the APEC (25 October-2 November; Period I) or 21.71 ppb after the APEC (13 November-31 December; Period III)” to “the values of 23.41 ppb in Period I (25 October-2 November) before the APEC and 21.71 ppb in period III (13 November-31 December) after the APEC”; Line 48: Change “Their” to “The”; Line 49: Change “drop” to “decrease”; Line 50: Change “of” to “over”; Line 51: Remove “the” before “southerly”; Line 52: Change
