

Dear Ryan,

We initially did not include the CFDC measurements from Prenni et al. (2009) because they reported total INP concentrations for immersion, deposition, and condensation mode. However, after discussing with Paul, he indicated that *most* of the INPs were dominated by immersion mode. I have now included data Paul provided from M-PACE in Table 2 and Figure 8 with a note indicating the concentrations are mostly from immersion INPs.

Thank you for your suggestion.

Cheers,
Jessie
