## Advanced methods for uncertainty assessment and global sensitivity analysis of a Eulerian atmospheric chemistry transport model

Ksenia Aleksankina, <sup>1,2</sup> Stefan Reis<sup>2,3</sup> Massimo Vieno<sup>2</sup> and Mathew R. Heal<sup>1</sup>

Figure S1 shows the spatial distribution of k-fold cross-validation errors for the Gaussian process emulators used to estimate the annual average surface concentrations of  $O_3$ ,  $NO_2$ , and  $PM_{2.5}$ . The k-fold cross-validation values were calculated as described by Lataniotis et al. (2017)

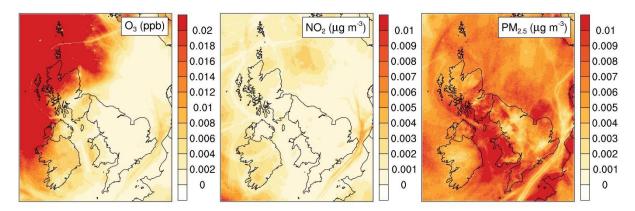

Figure S1 Spatial distribution of k- fold cross validation error values for emulated annual average concentrations of O<sub>3</sub>, NO<sub>2</sub>, and PM<sub>2.5</sub>.

Figure S2 shows the scatter plot of the first-order sensitivity indices against the total sensitivity indices. The grey lines indicate  $\pm$  3% fluctuation in the sensitivity index values, which were attributed to numerical errors in the calculation of sensitivity indices the analytical values of which are close to zero.
