

## S1 Analysis of the errors in wet deposition due to errors in the primary particulate matter emissions

Errors were found in the emissions of primary particulate matter for Russia and North African countries and shipping for the period 1991-1999. Unfortunately it was not possible to re-run the simulations since these errors were not detected until late in the data analysis. In order to estimate the impact on the wet deposition estimates, the CHIMERE model was used to simulate wet deposition using the incorrect and corrected emissions for 1998, the year for which the emission error is the largest. Figure S1 shows the relative errors in the model estimates of WNOx, WNHx and WSOx as a result of the errors in emissions. Errors in WNOx and WSOx were less than 0.5% in most of the domain with maximum errors of 0.95% and 1.5%, respectively. Errors in WNHx were also mostly below 0.5% but larger errors were estimated for about a quarter of the domain (mostly in the northeast), with a maximum error of 2.4%. These errors are small compared with the overall uncertainty of the model estimates and the uncertainty of the observations. Errors in the trends calculated from the simulations with erroneous emissions are expected to be smaller than the errors in annual deposition rates. From this analysis we conclude that the error in emissions is unlikely to affect the results and conclusions of the study significantly.

**Figure S1: Maps of relative difference between the model estimates of WNOx, WNHx and WSOx for the simulations using the original (incorrect) emissions and those using the corrected emissions of primary PM in Russia, North Africa and maritime areas for 1998. Circles show the locations of the sites used to evaluate modelled deposition. Note: Positive values indicate that the emission error resulted in larger values of wet deposition and vice versa.**

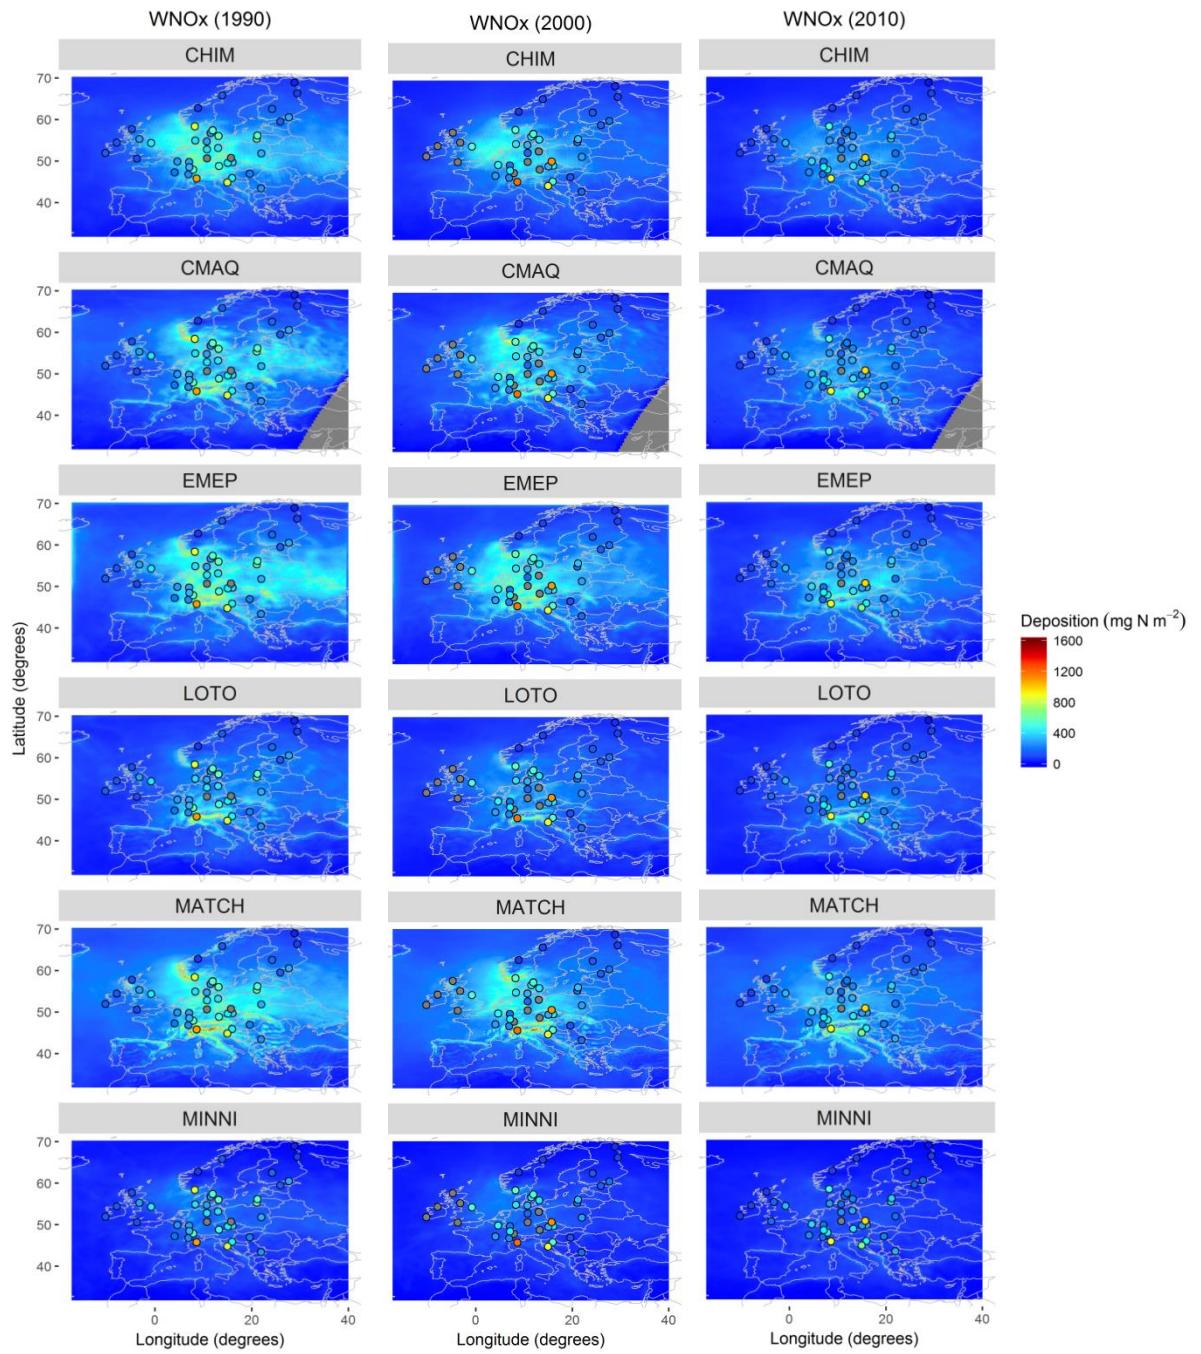

**Figure S3: Maps of the trends (Sen's slopes) in the gridded  $\text{NO}_x$ ,  $\text{NH}_3$  and  $\text{SO}_x$  emissions used in the model simulations for the two ten year periods.**

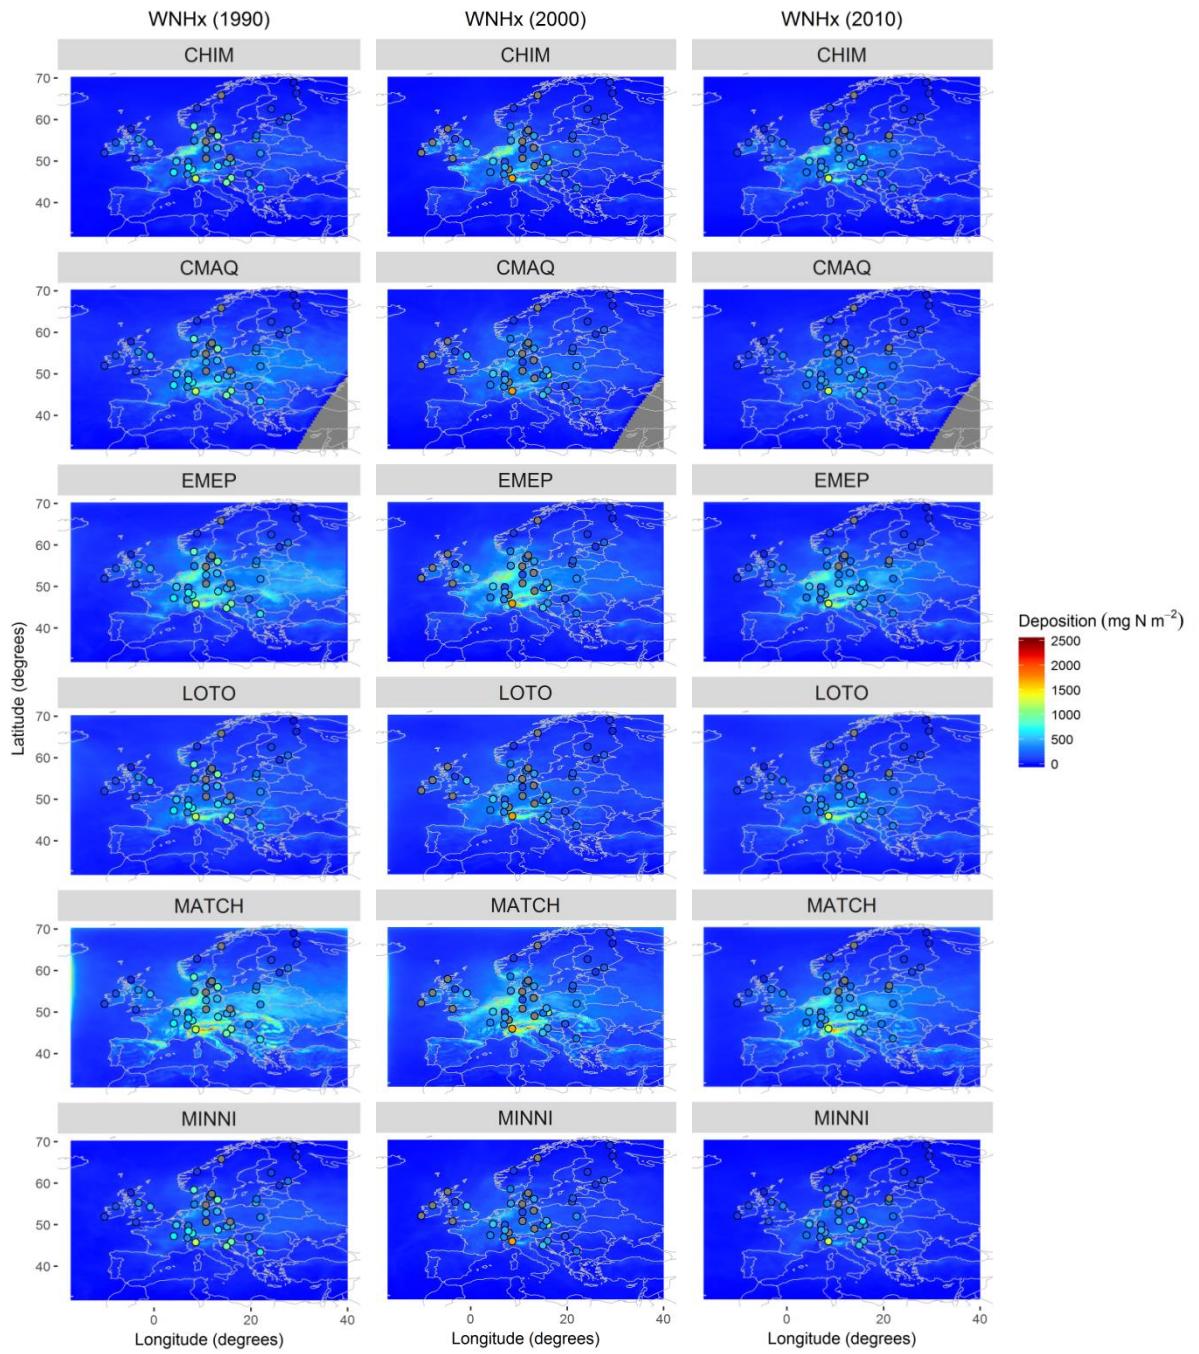

**Figure S4: Maps of the relative trends (trend divided by the estimated emission at the beginning of the period) in the gridded  $\text{NO}_x$ ,  $\text{NH}_3$  and  $\text{SO}_x$  emissions used in the model simulations for the two ten year periods.**

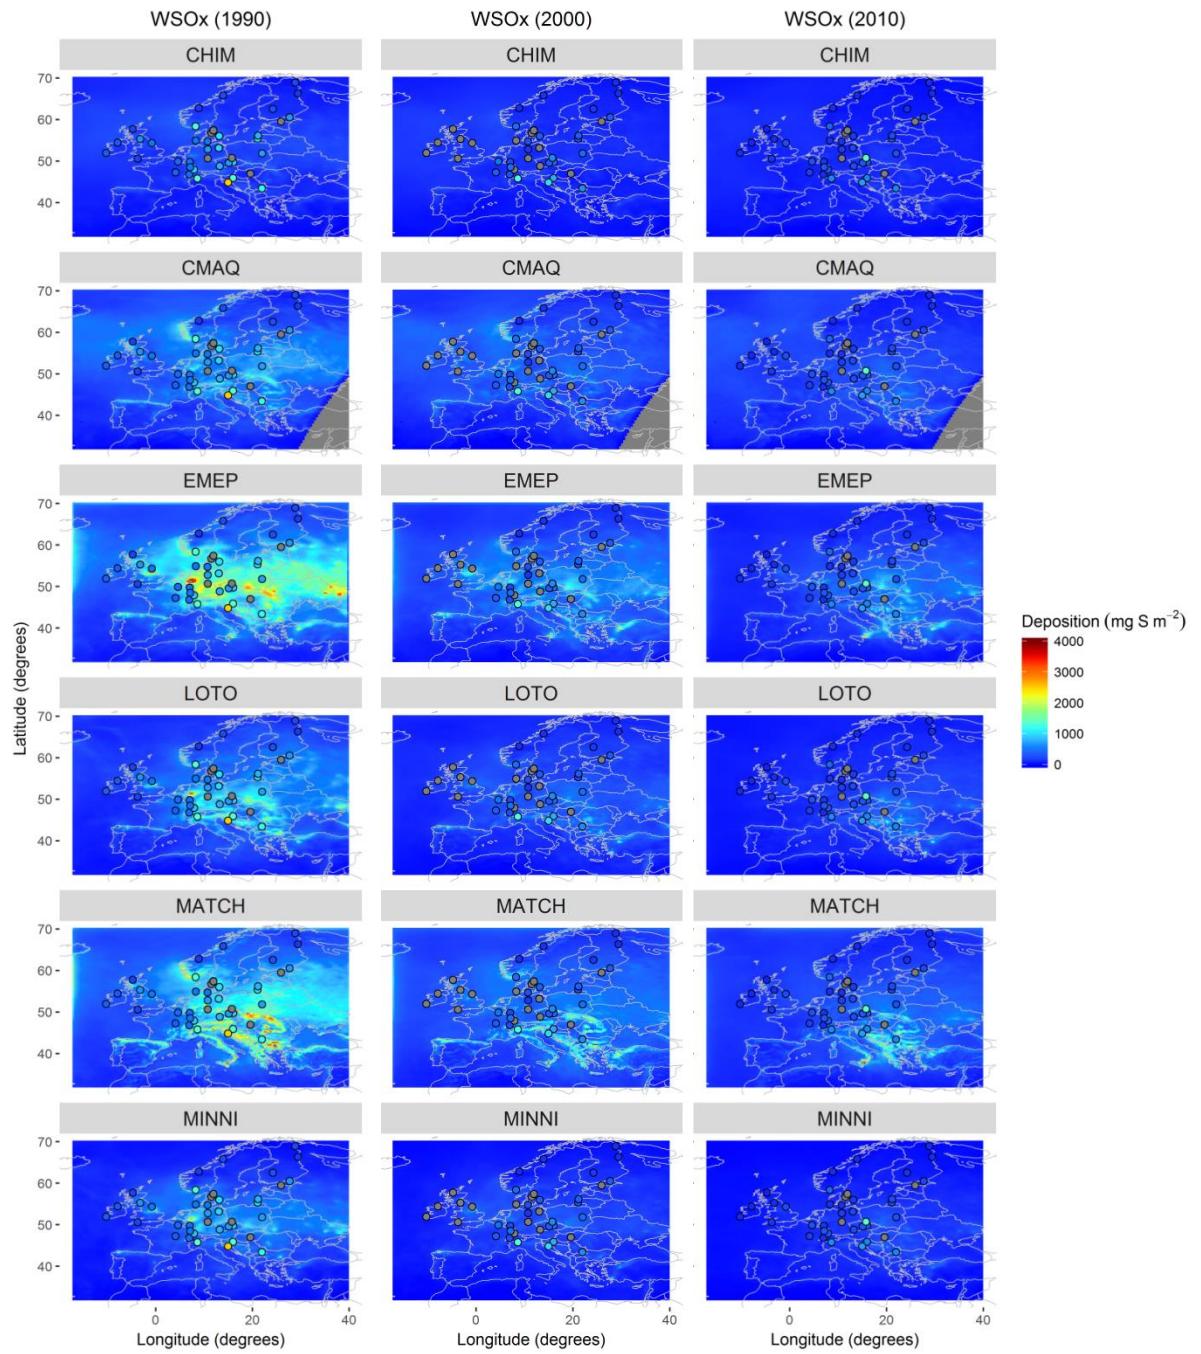

**Figure S5:** Accumulated annual precipitation estimated by the four meteorological models used in the simulations by CMAQ, LOTO, MATCH and the rest of the models (OTHERS) for the years 1990 (left), 2000 (centre) and 2010 (right). The observed precipitation is shown by the coloured circles (grey indicates no data).

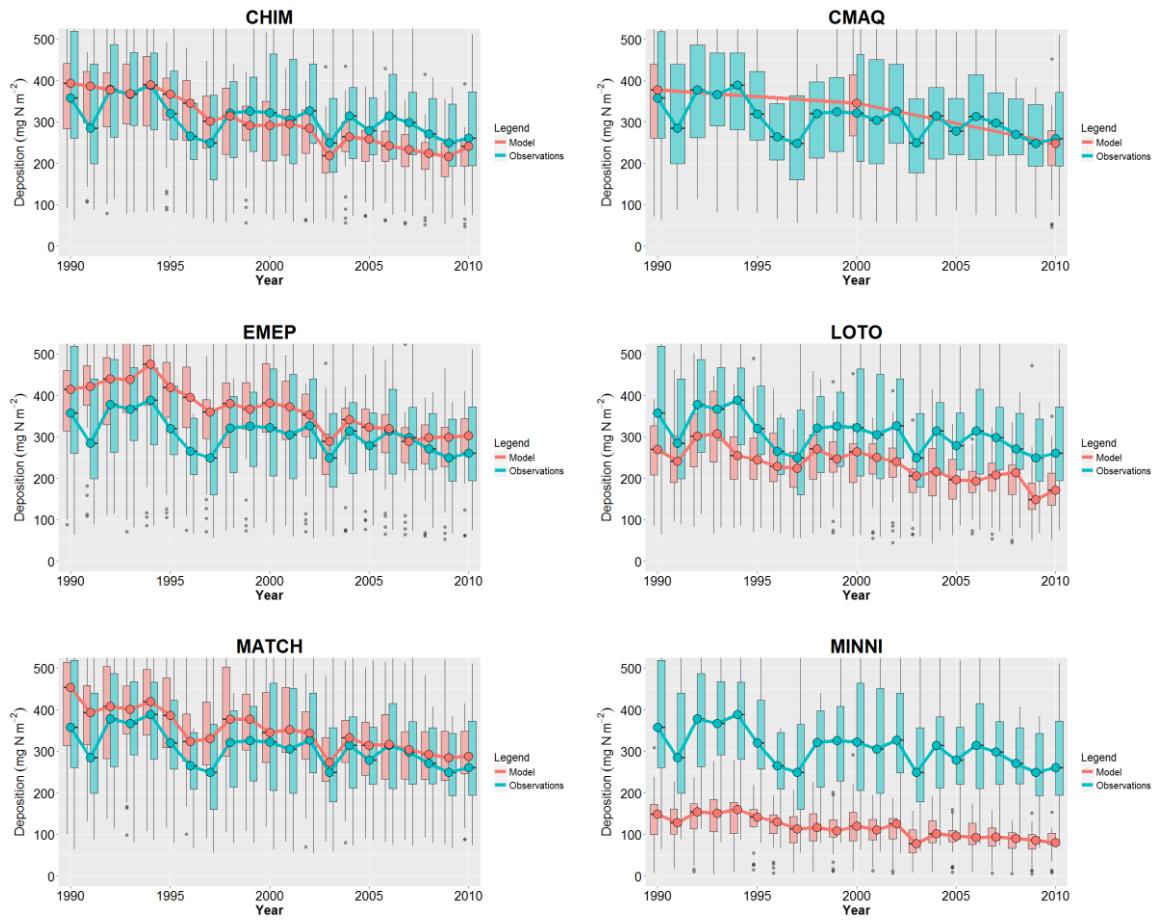

**Figure S6:** Accumulated annual WNOx deposition estimated by the six models for the years 1990 (left), 2000 (centre) and 2010 (right). The observed deposition is shown by the coloured circles (grey indicates no data).

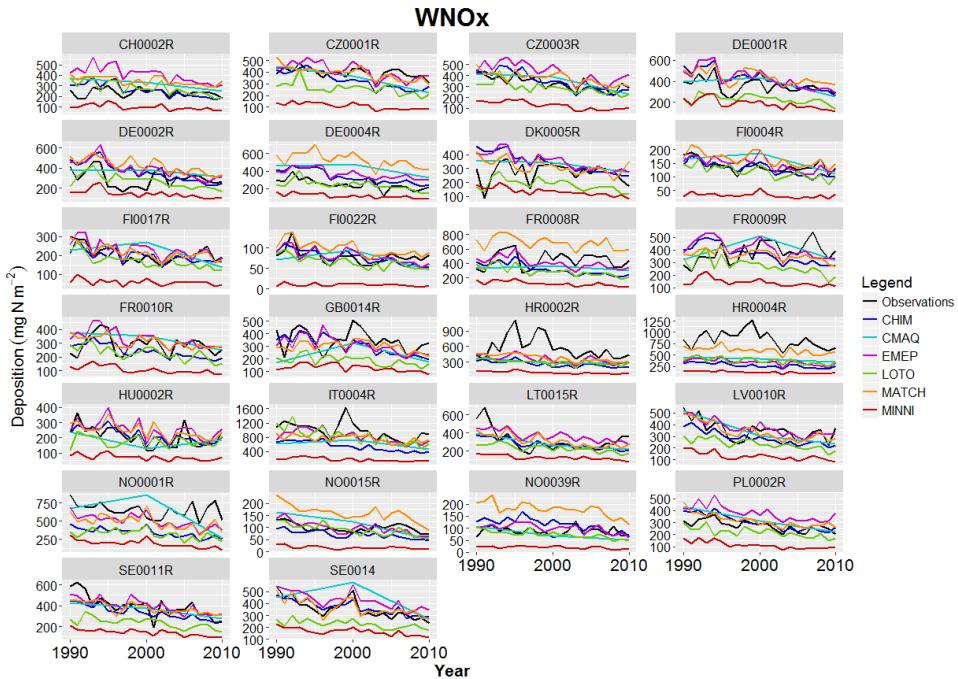

**Figure S7:** Accumulated annual WNHx deposition estimated by the six models for the years 1990 (left), 2000 (centre) and 2010 (right). The observed deposition is shown by the coloured circles (grey indicates no data).

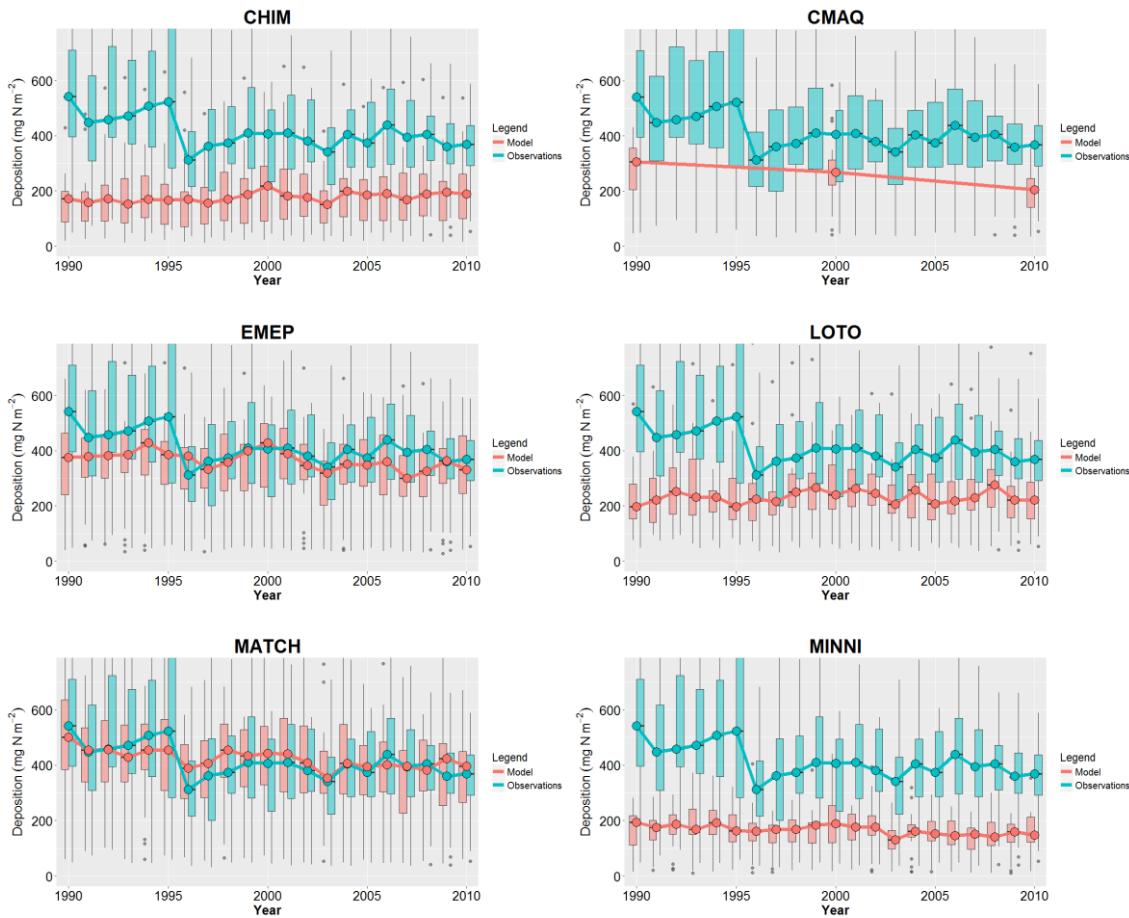

**Figure S8:** Accumulated annual WSOx deposition estimated by the six models for the years 1990 (left) and 2010 (right). The observed deposition is shown by the coloured circles (grey indicates no data).

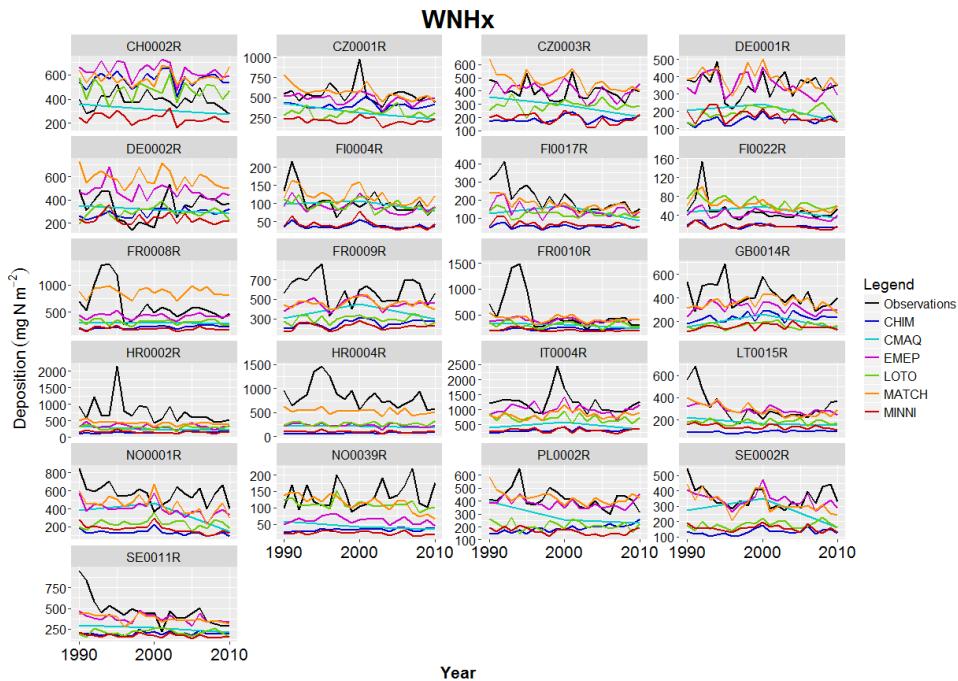

**Figure S9: Tukey-style box plots of the time series of observed and modelled WNOx. Circles represent the annual median value for all measurement sites with a complete 21 year time series.**

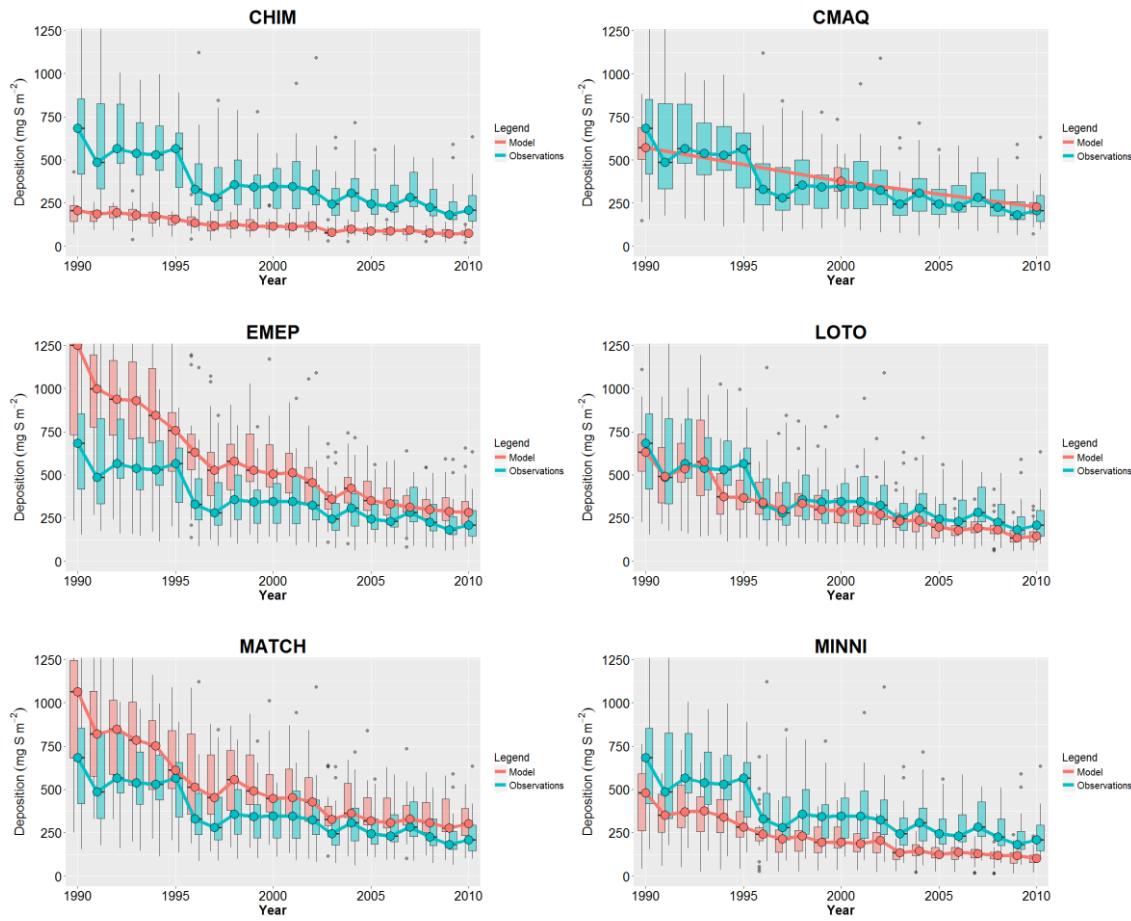

**Figure S10: Time series of observed and modelled WNOx for all measurement sites with a complete 21 year time series.**

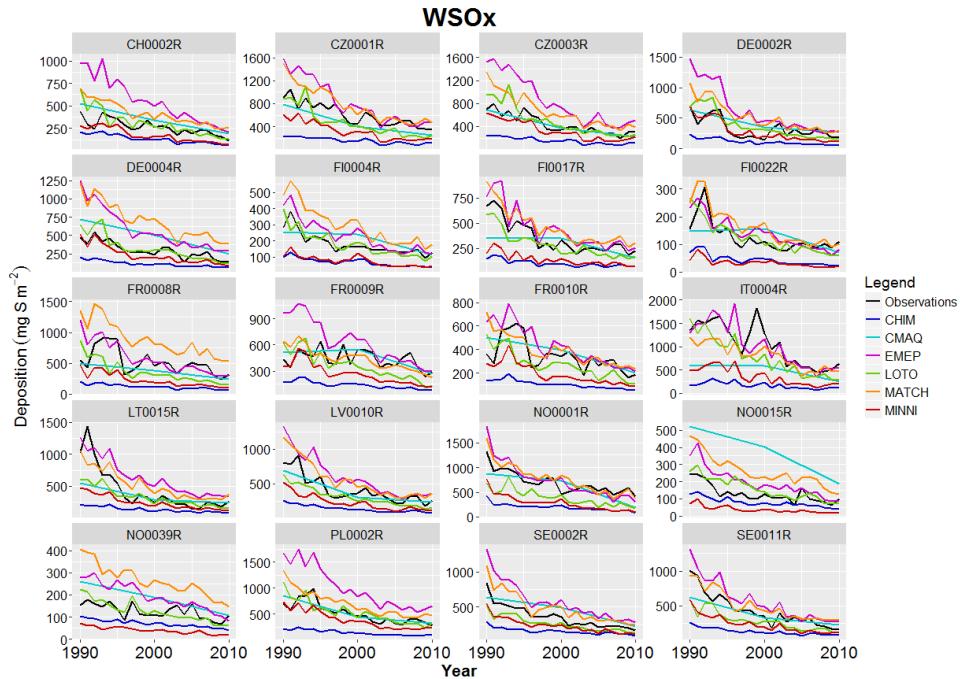

**Figure S11: Tukey-style box plots of the time series of observed and modelled WNHx. Circles represent the annual median value for all measurement sites with a complete 21 year time series.**

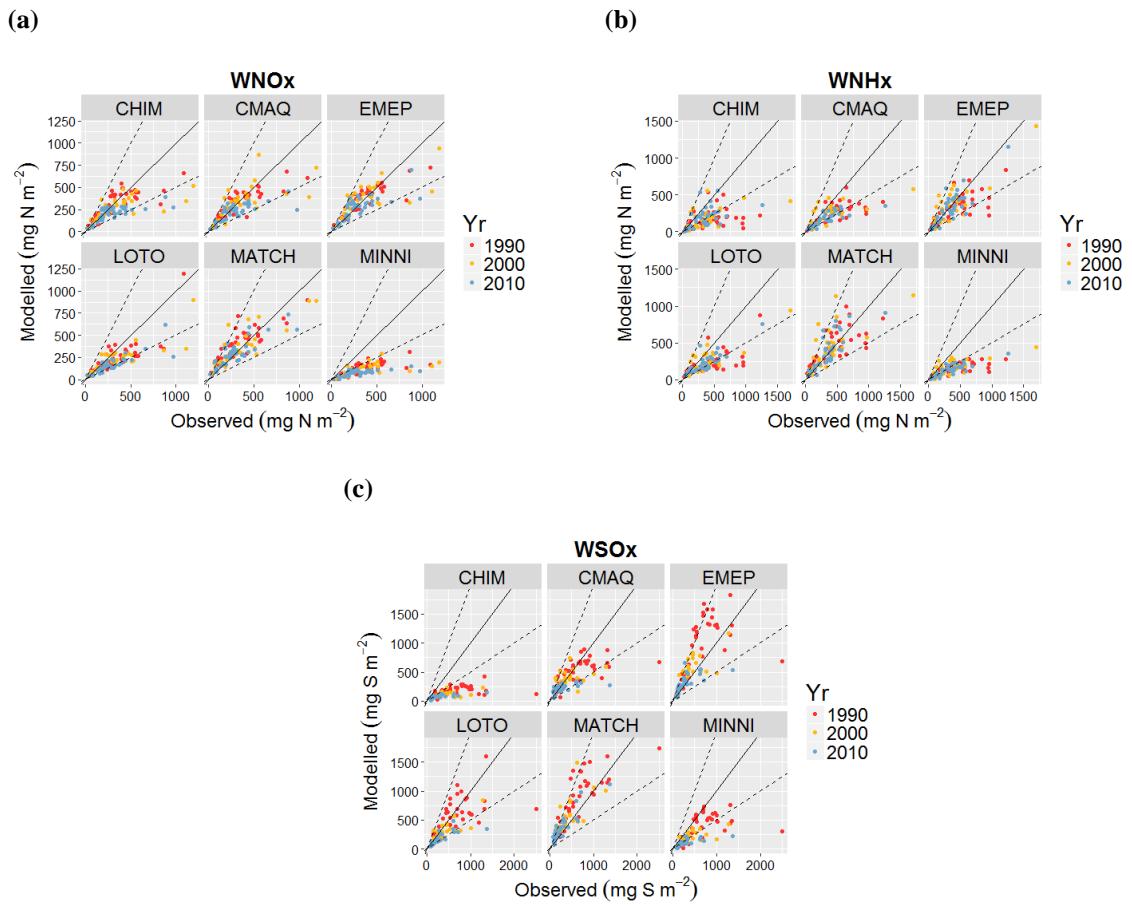

**Figure S12: Time series of observed and modelled WNHx for all measurement sites with a complete 21 year time series.**

**Figure S13:** Tukey-style box plots of the time series of observed and modelled WSOx. Circles represent the annual median value for all measurement sites with a complete 21 year time series.

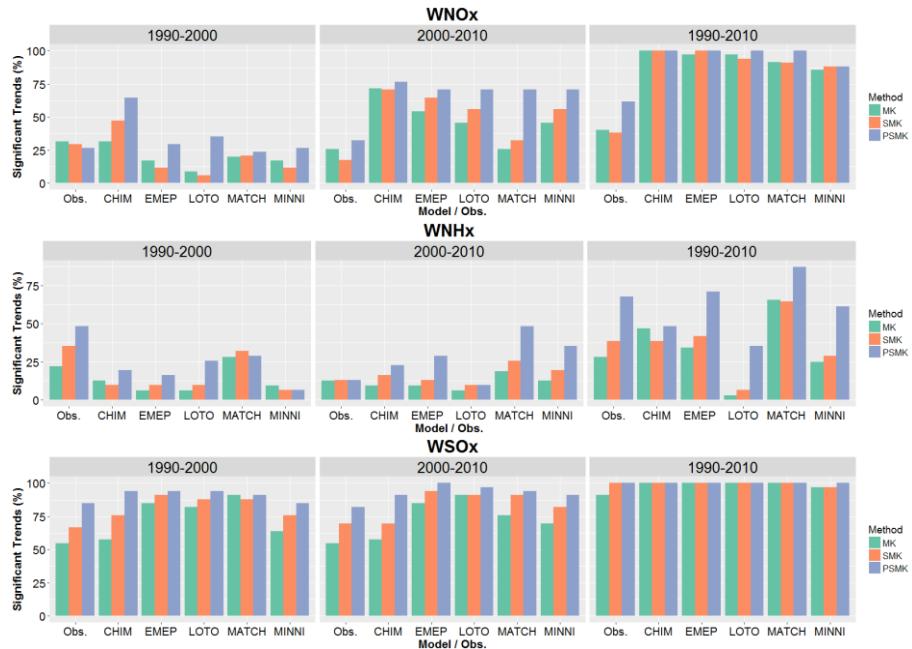

**Figure S14:** Time series of observed and modelled WSOx for all measurement sites with a complete 21 year time series.

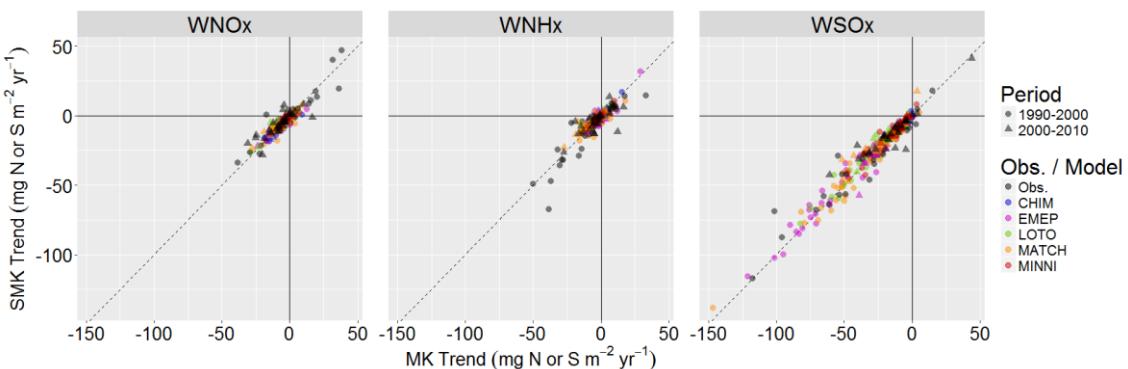

**Figure S15: Modelled vs. observed wet deposition of a) WNOx, b) WNHx and c) WSOx for the years 1990, 2000 and 2010 (colour scale).**

**Table S3: Performance evaluation of the six models that simulated the individual years 1990, 2000 and 2010 and the five models that simulated the full 21 year time series for the three deposition components WNOx, WNHx and WSOx. Values meeting the acceptability criteria of Chang and Hanna (2004) are highlighted in bold green text. FAC2 is the fraction of model predictions within a factor of two of the observations, MG is the geometric mean bias, VG is the geometric variance, FB is the fractional bias, NMSE is the normalised mean squared error and r is the Pearson correlation coefficient.**

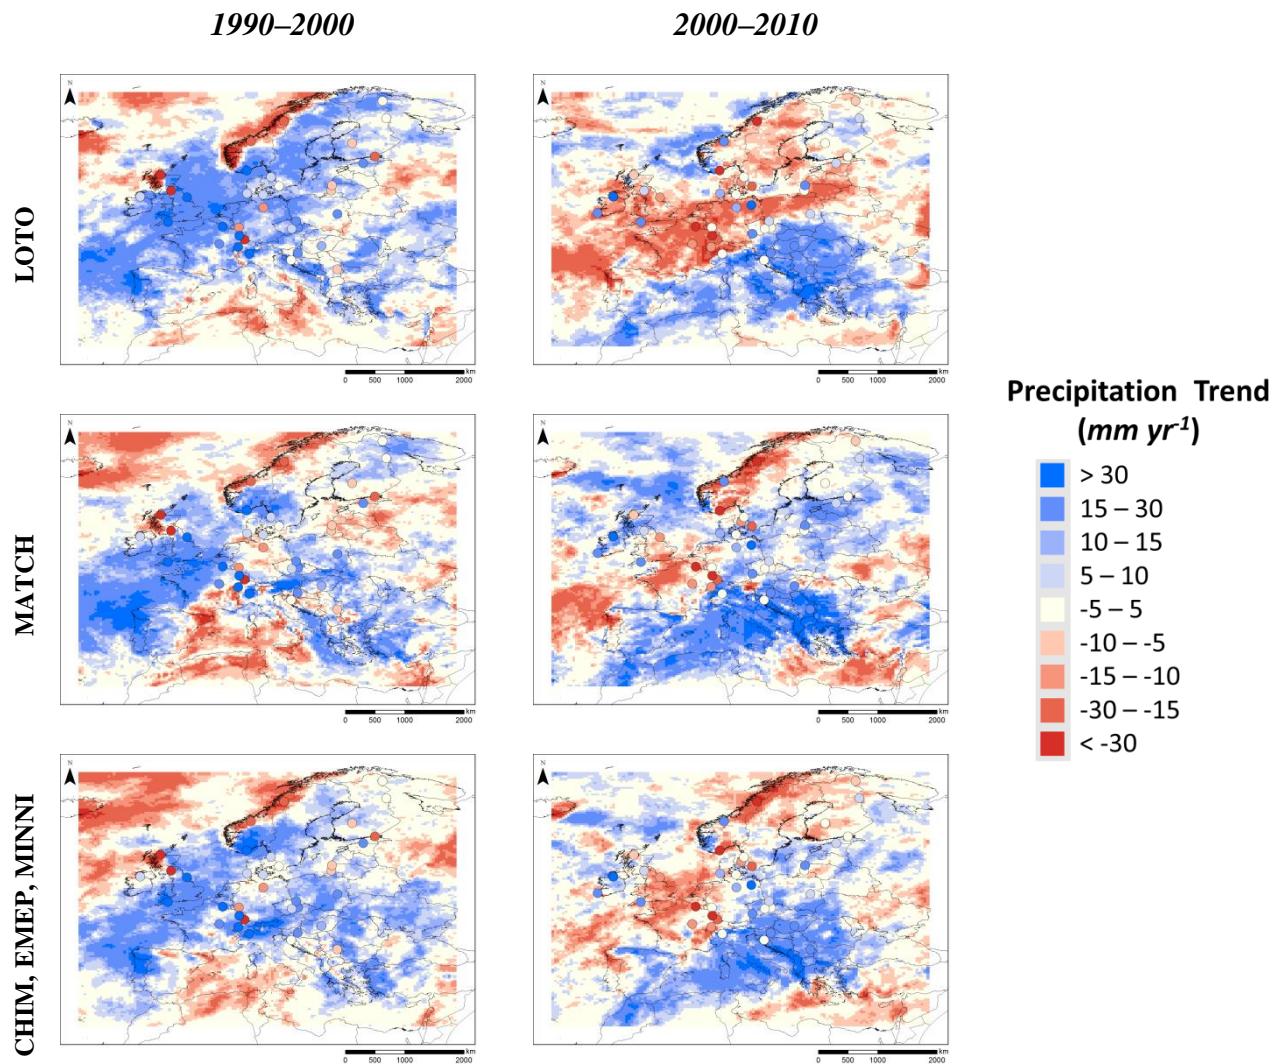

**Figure S16:** Proportion of observed/modelled trends that are significant for each trend estimation method (MK: Mann-Kendall; SMK: Seasonal Mann-Kendall; PSMK: Partial Seasonal Mann-Kendall) for WNOx (top), WNHx (middle) and WSOx (bottom) for the two 10 year periods and the full 20 year period.

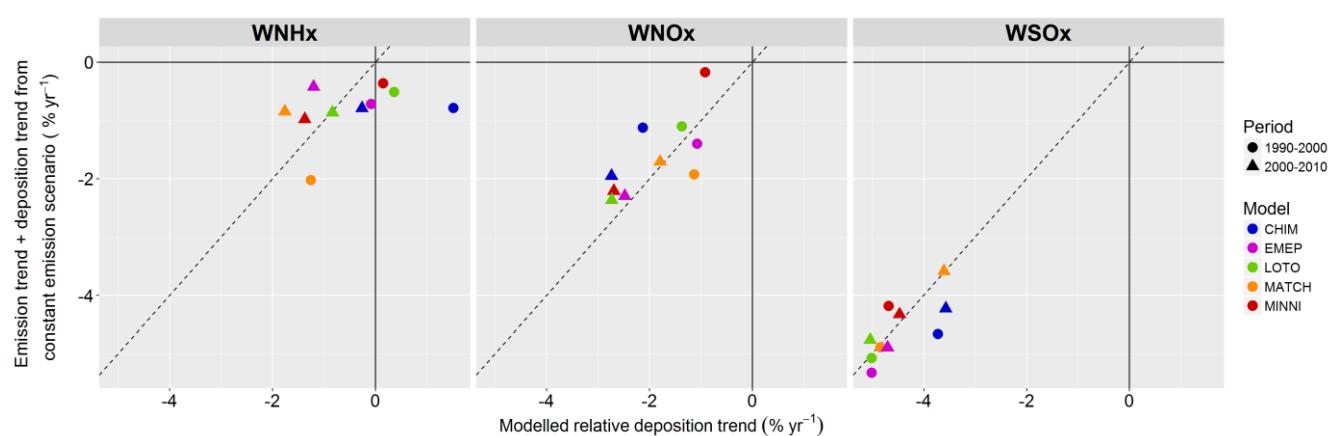

**Figure S17:** Observed/modelled absolute trends of WNOx, WNHx and WSOx calculated using the Seasonal Mann-Kendall (SMK) method versus those calculated using the Mann-Kendall (MK) method for the different time periods (symbols). The dashed line is the 1:1 line.

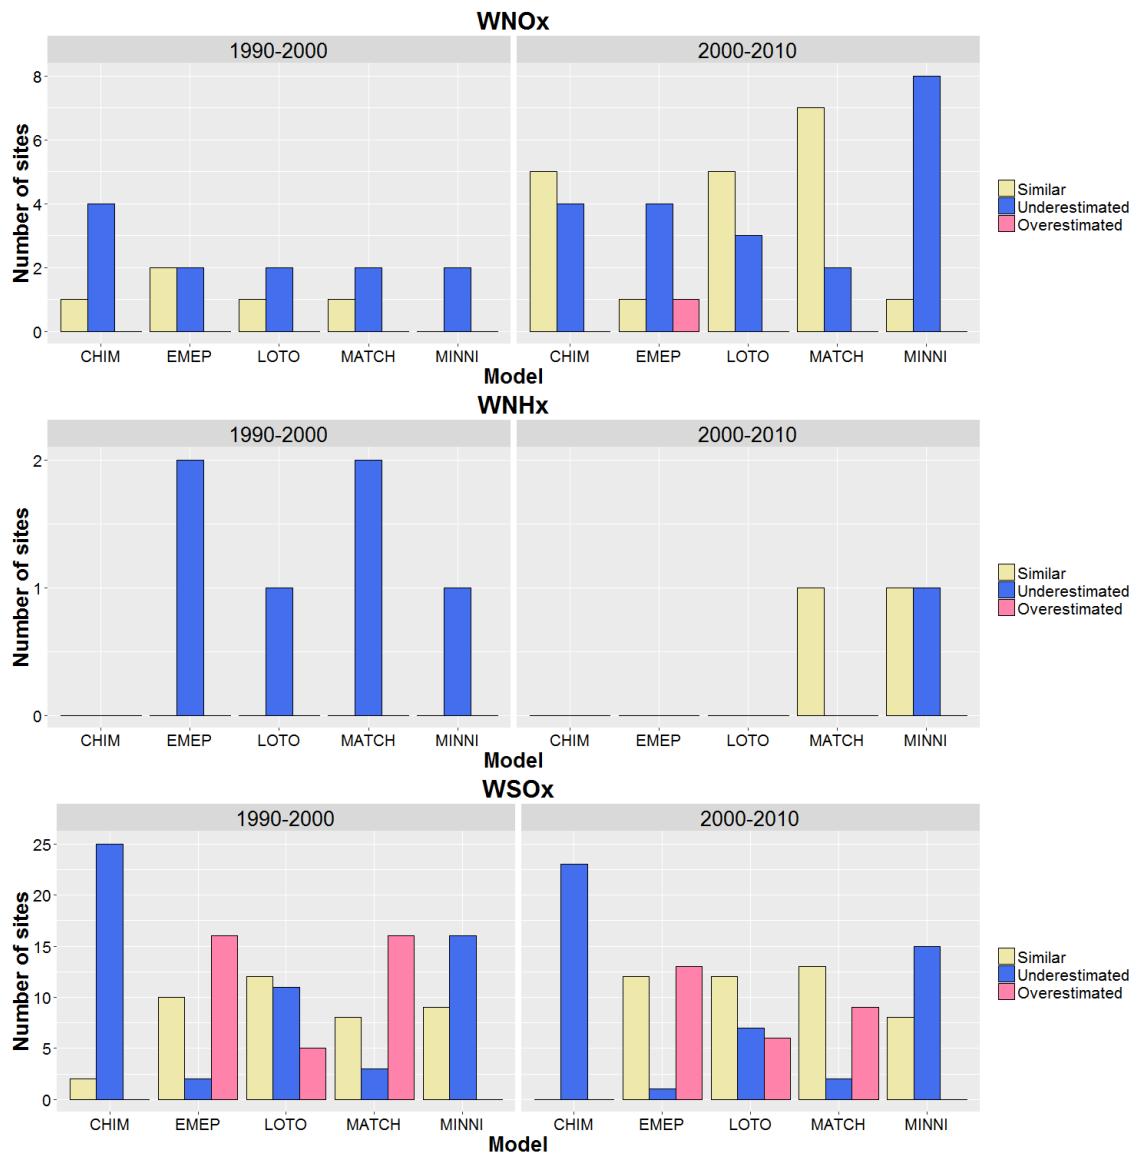

**Figure S18:** Observed/modelled relative trends of WNOx, WNHx and WSOx calculated using the Seasonal Mann-Kendall (SMK) method versus those calculated using the Mann-Kendall (MK) method for the different time periods (symbols). The dashed line is the 1:1 line.

**Figure S19:** Maps of modelled (coloured field) and observed (circles) precipitation trends for the periods 1990-2000 and 2000–2010.

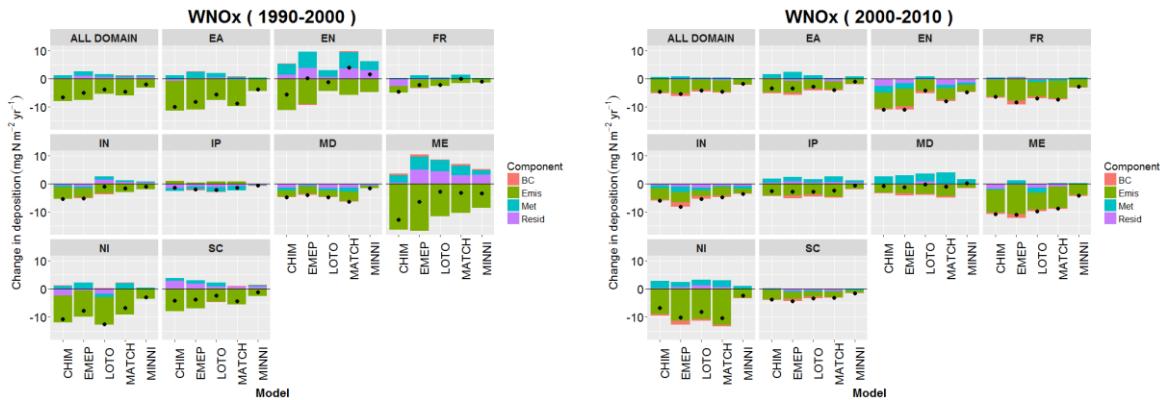

**Figure S20:** Scatter plots showing the sum of the median domain emission trends and the median wet deposition trends for the simulations with constant emissions vs. the median wet deposition trends for the simulations with changing emissions.

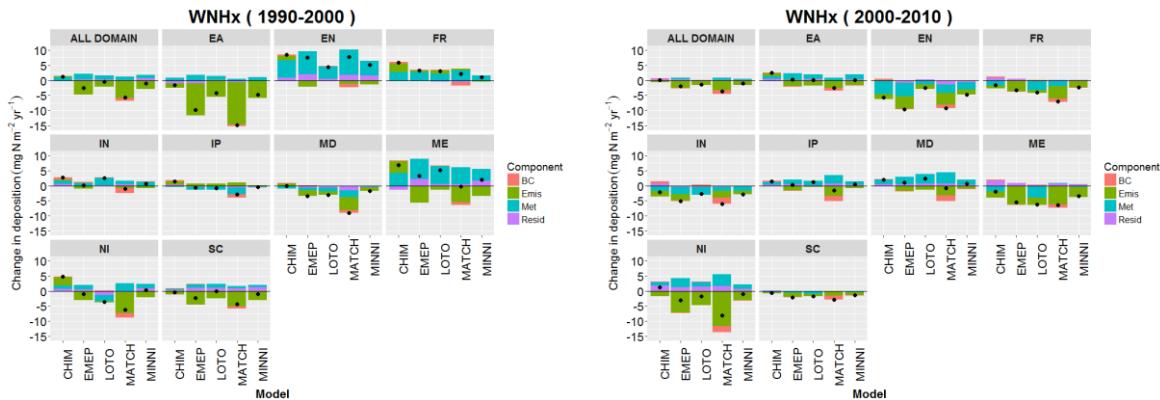

**Figure S21:** Number of sites for which the five models estimated statistically similar trends to those observed (i.e. have overlapping 95% confidence intervals) or underestimated or overestimated the observed trends. Only sites with significant ( $p < 0.05$ ) observed and modelled trends are shown.

**Table S4: Performance evaluation of the absolute and relative trends of WSOx for the two ten year periods. Values meeting the acceptability criteria of Chang and Hanna (2004) are highlighted in bold green text. FAC2 is the fraction of model predictions within a factor of two of the observations, FB is the fractional bias, NMSE is the normalised mean squared error and r is the Pearson correlation coefficient.**
