Co-Editor's comment:

I could accept that the current version addressed most of the comments from reviewers. I agree that the original idea of split the work into part I and part II is not that necessary, the current version needs to answer the driving force of pattern of the ozone and its precursors. Therefore I suggest to remove the wording such as part I and Part II, change the title of the current version to temporal variations and trend of ground-level ozone based on long-term measurements in Windsor, Canada.

Response:

We have changed the title as suggested by the co-editor. Thank you.
