

Dear editors,

In the last proof-reading, we want to correct the unit of LWC in Equation 1 and 2. The detailed explanation is as follows.

With regards,

Shuqi Yan, Bin Zhu*, and all co-authors

The original Equation 1 and 2 are:

$$(1) \text{ VIS}[\text{m}] = 27\text{LWC}[\text{g cm}^{-3}]^{-0.88}$$
$$(2) \text{ VIS}[\text{m}] = 1002\left(\text{LWC}[\text{g cm}^{-3}] \cdot N_d[\text{cm}^{-3}]\right)^{-0.6473}$$

We want to change the unit of LWC from g cm^{-3} to g m^{-3} .

Equation 1 is from Kunkel (1983), and Equation 2 is from Gultepe et al. (2006). In these two papers, the units of LWC is g m^{-3} (e.g., Figure 1 and 2). We have carefully checked our code that calculates the visibility. The unit of LWC is correctly treated as g m^{-3} . Therefore, it is only a typo in the paper.

Eldridge (1966) derived the following empirical relationship between β and W for “stable and evolving” fogs based on fog drop-size distributions inferred from measured spectral transmission through fog with the aid of Mie scattering theory. The droplet range measured was 0.6–16 μm diameter,

$$\beta = 163W^{0.65}, \quad (6)$$

where W is in g m^{-3} and β is in km^{-1} .

Figure 1. The screenshot from Kunkel (1983). Here the "W" means LWC.

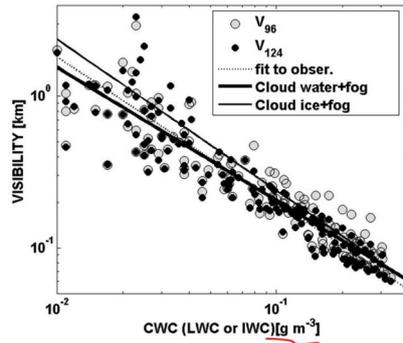

FIG. 3. The visibility calculated from FSSP measurements and from K84 Vis-LWC (as cloud water + fog) and Vis-IWC (as cloud ice + fog) relationships. The V_{96} and V_{124} are for FSSP-96 (over original size ranges) and FSSP-124 (over extended size ranges) observations, respectively.

Figure 2. The screenshot from Gultepe et al. (2006).
