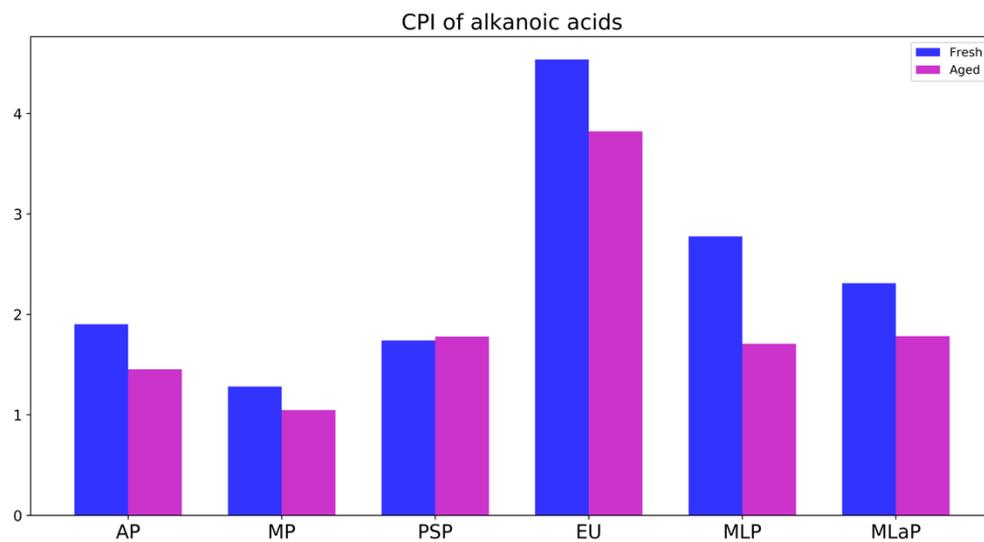

Figure S1. Carbon performance index (CPI) of gas- and particle-phase alkanolic acids assigned to six different fuels: Alaskan peat (AP), Moscow peat (MP), Pskov peat (PSP), Eucalyptus (EU), Malaysian peat (MLP), Malaysian agricultural peat (MLaP). CPI was calculated by calculating even-over-odd ratios of monocarboxylic acids ranging from C₆ to C₂₄.

Table S1: Emission factors (in mg kg⁻¹) for fresh emissions in both gas and particle phase

Compound name	Alaskan peat		Moscow peat		Pskov peat		Eucalyptus		Malaysian peat		Malaysian agro peat		Group name
	Gas	Particle	Gas	Particle	Gas	Particle	Gas	Particle	Gas	Particle	Gas	Particle

Levoglucosan*				0.69±0.02	0.67±0.02	

*Levoglucosan data were analyzed using IC-PAD technique for two fuels

3.3.4 Aromatic Acids

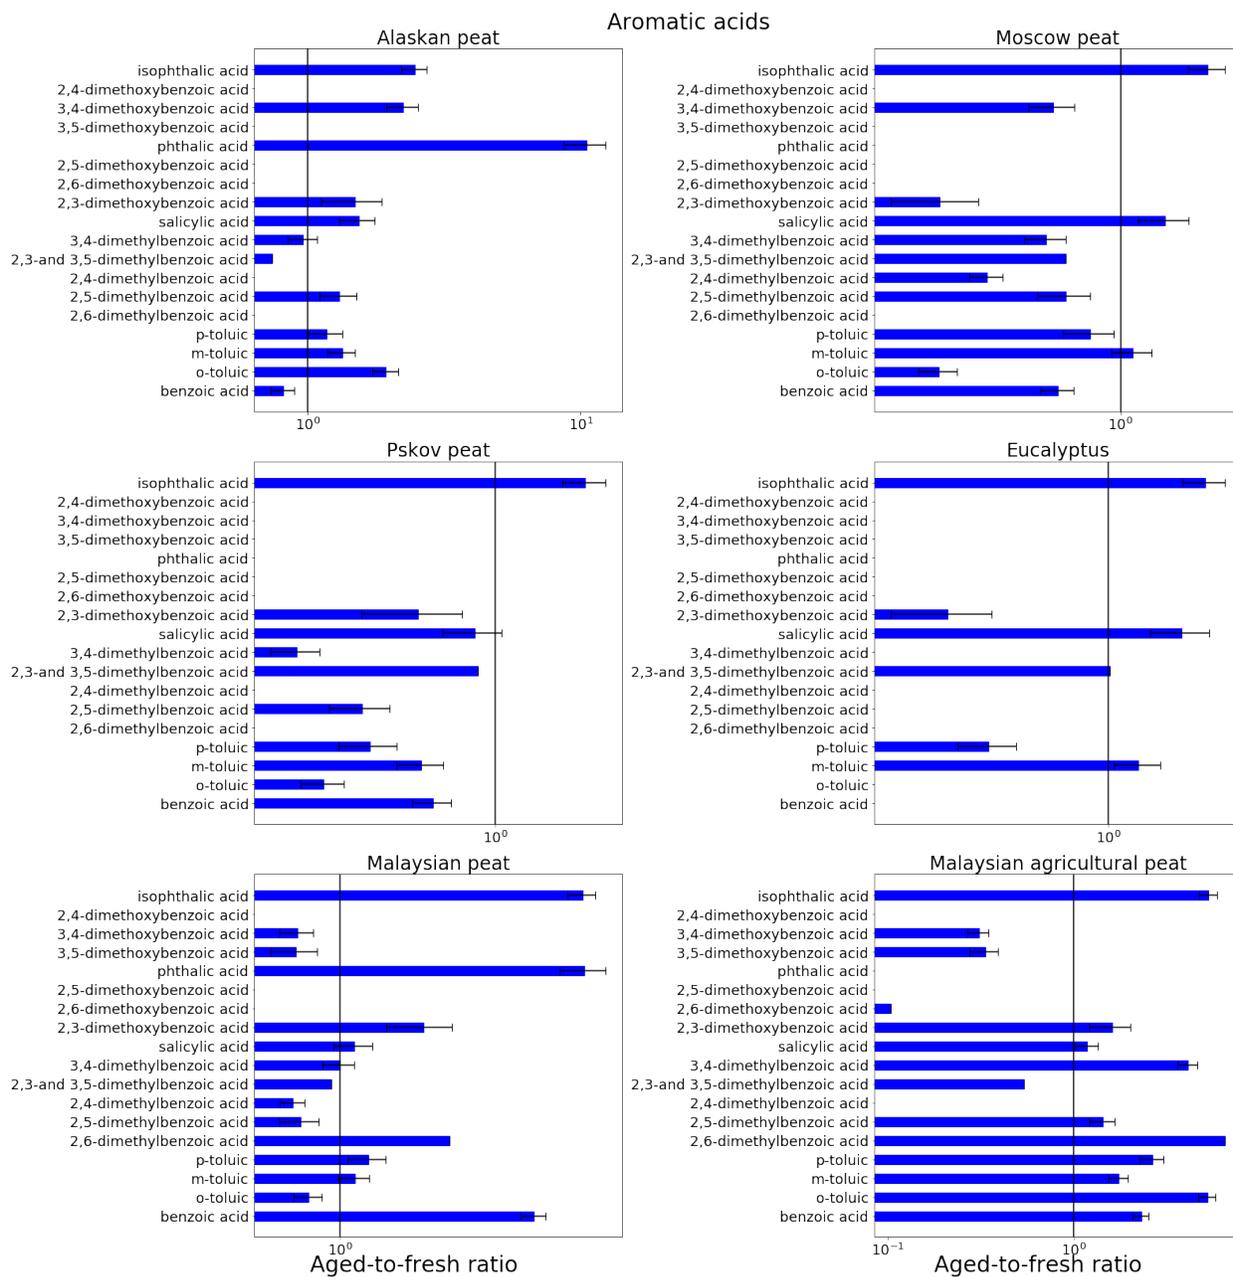

Figure S2a. Aged-to-fresh ratios of total (gas + particle) EF's for aromatic acids from biomass burning emissions for six different biomass type presented in log scale . We did not burn fuels in replicates, and SD were calculated based on replicate analysis of similar fuels (with same experimental conditions) from our previous campaigns. SD values derived from EFs were scaled to ratio.

3.3.5 Resin Acids

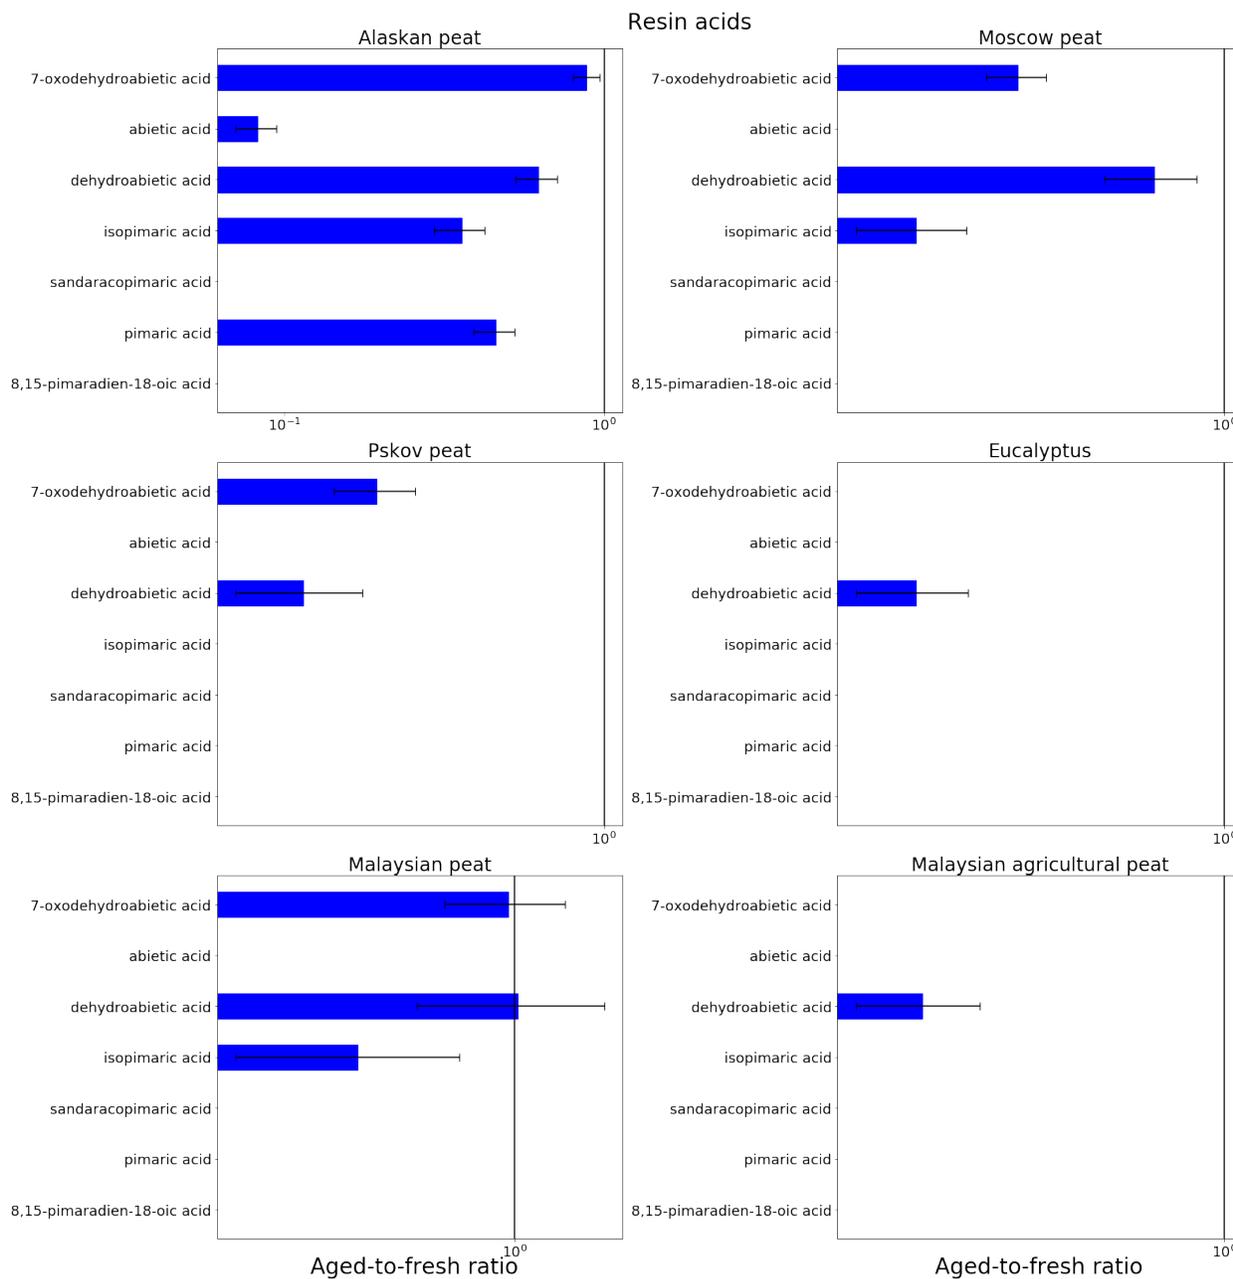

Figure S2b. Aged-to-fresh ratios of total (gas + particle) EFs for resin acids from biomass burning emissions for six different biomass type presented in log scale. We did not burn fuels in replicates, and SD were calculated based on replicate analysis of similar fuels (with same experimental conditions) from our previous campaigns. SD values derived from EFs were scaled to ratio.
