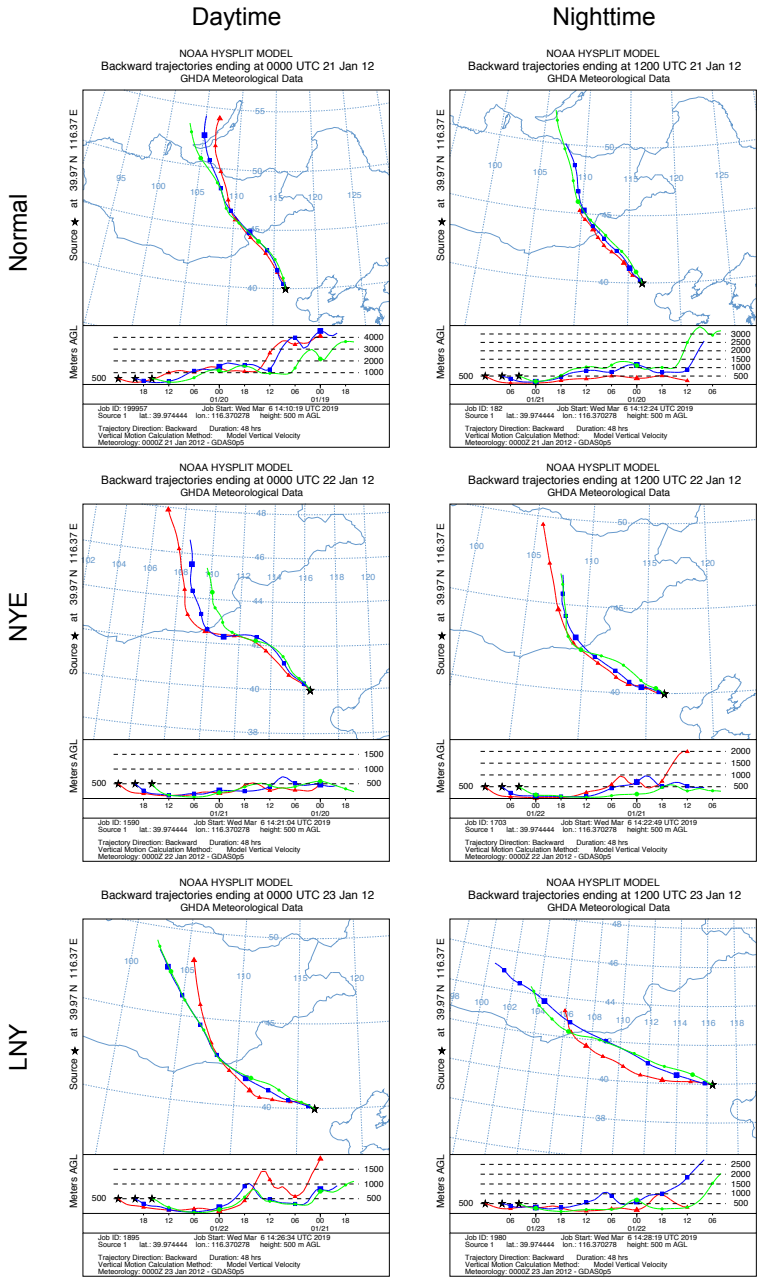

Figure S1: The clustering air mass two-day backward trajectories.

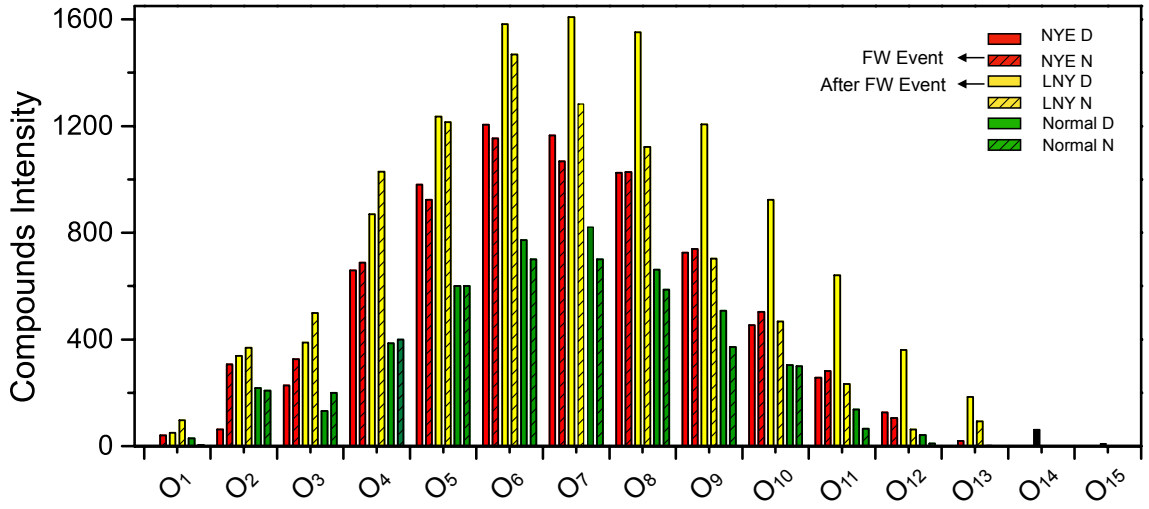

Figure S2: Intensity of CHO species of subgroups according to the number of O atoms in their molecules.

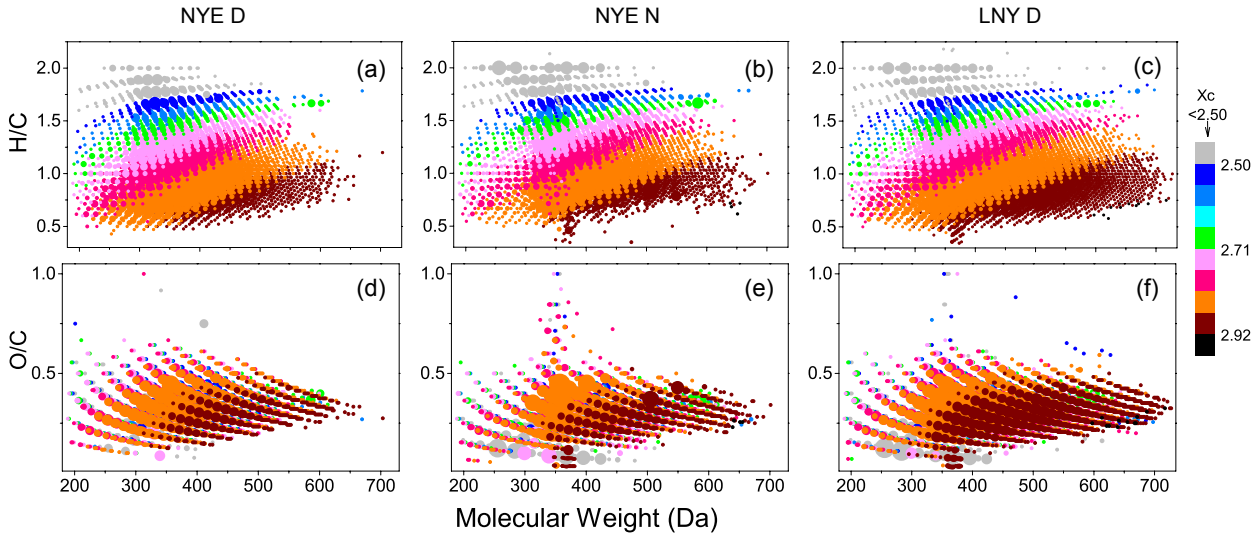

Figure S3: The H/C (**a, b, c**) and O/C (**d, e, f**) ratios of CHO formulae are shown as a function of their neutral mass from NYE D (**a, d**), NYE N (**b, e**) and LNY D (**c, f**) samples with their X_c values color-coded. Grey data points indicate non-aromatic compounds (X_c<2.5), blue to green data (2.5<X_c<2.71) are mono-aromatic compounds and pink to black data (X_c>2.71) includes PAHs. The size of the symbols reflects the relative peak intensities of molecular formulae on a logarithmic scale.

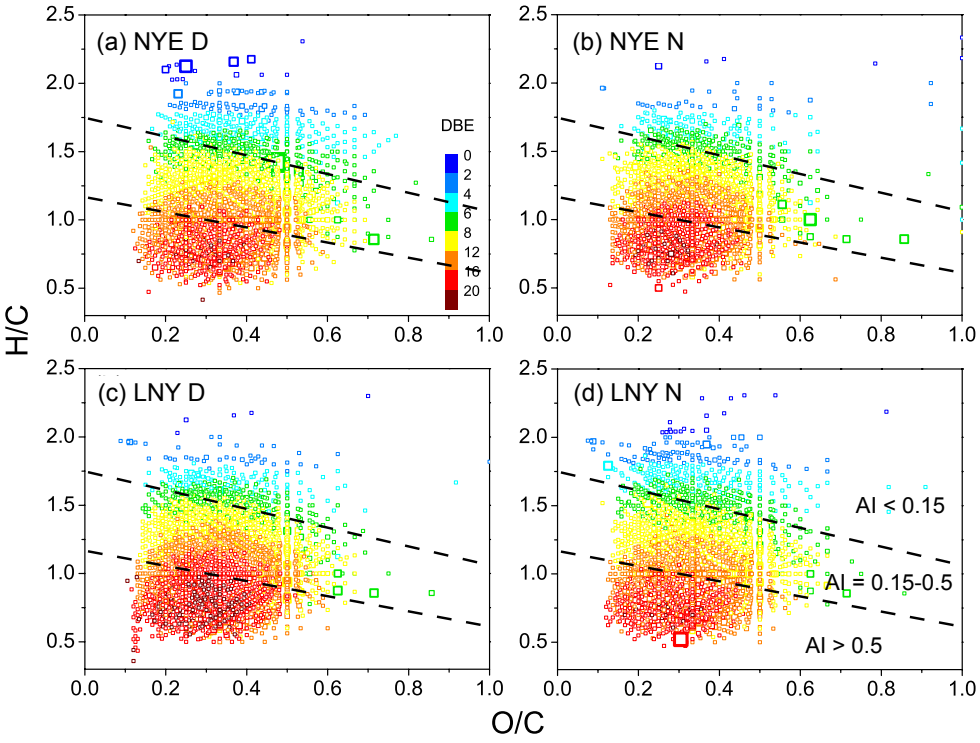

Figure S4: Van Krevelen diagrams (the H/C via O/C ratios) for the CHNO compounds with various aromatic index (AI) values ranges. The dashes lines separate the different AI regions. The size of the symbols reflects the relative peak intensities of compounds on a logarithmic scale.

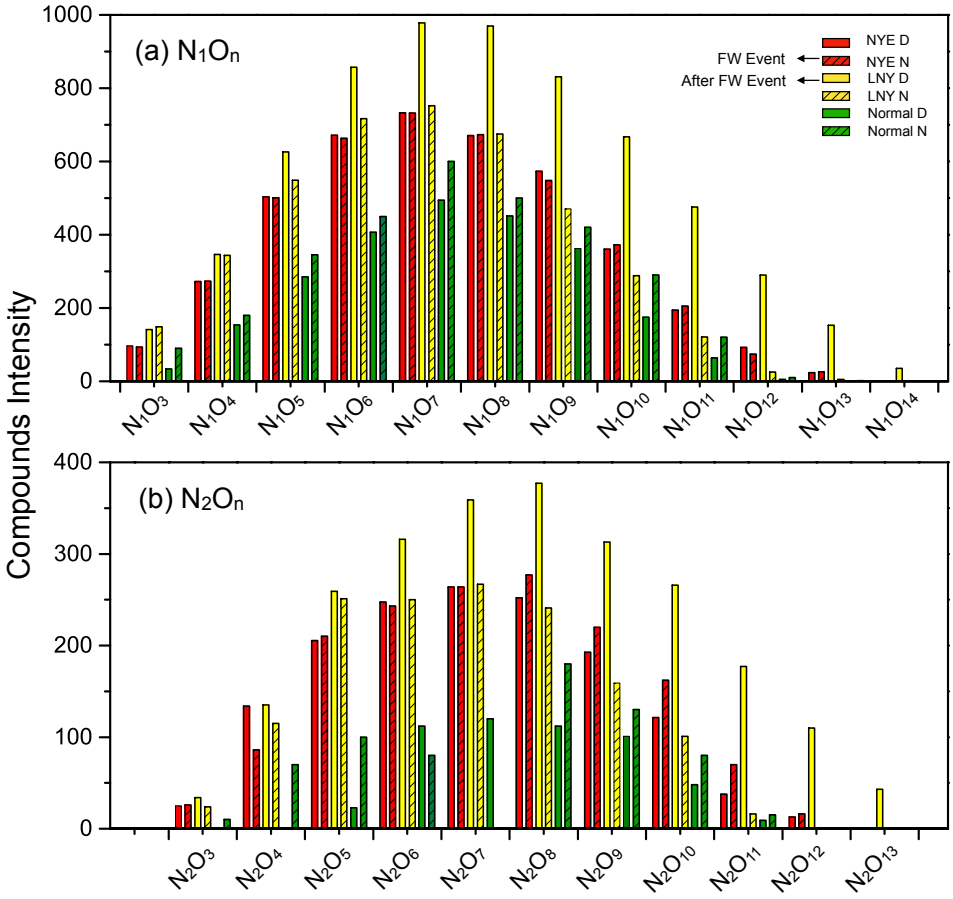

Figure S5: Intensity of CHNO species of subgroups according to the number of N and O atoms in their molecules.

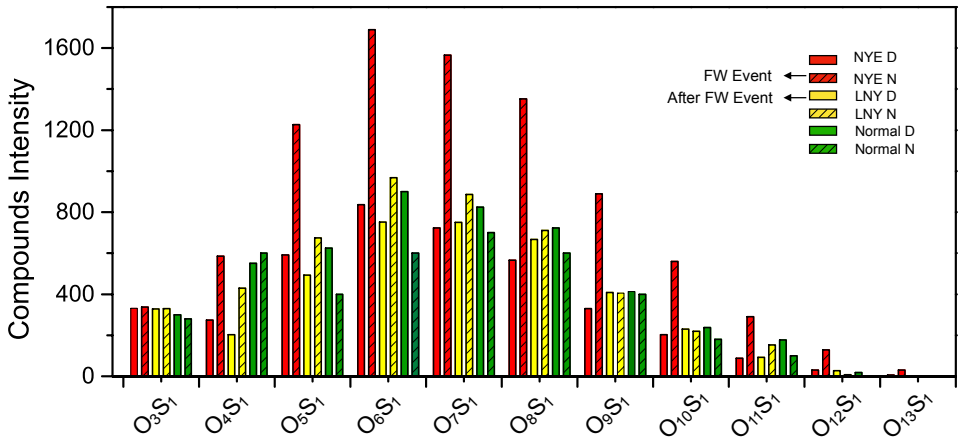

Figure S6: Intensity of CHOS species of subgroups according to the number of O and S atoms in their molecules.

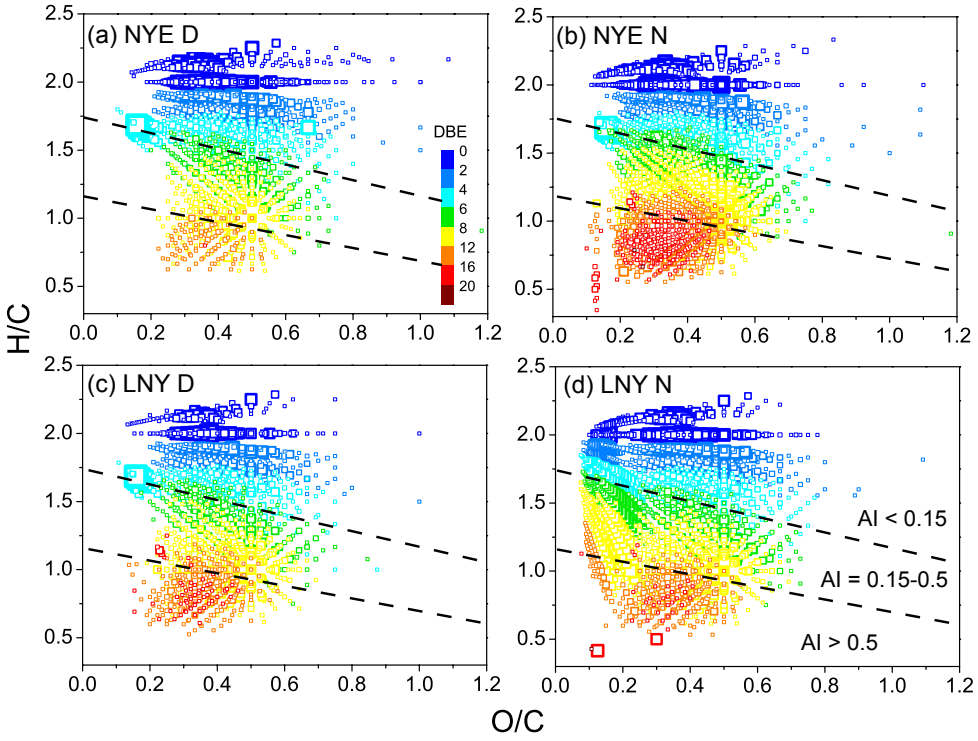

Figure S7: Van Krevelen diagrams (the H/C via O/C ratios) for the CHOS compounds with various aromatic index (AI) values ranges. The dashes lines separate the different AI regions. The size of the symbols reflects the relative peak intensities of compounds on a logarithmic scale.
