14

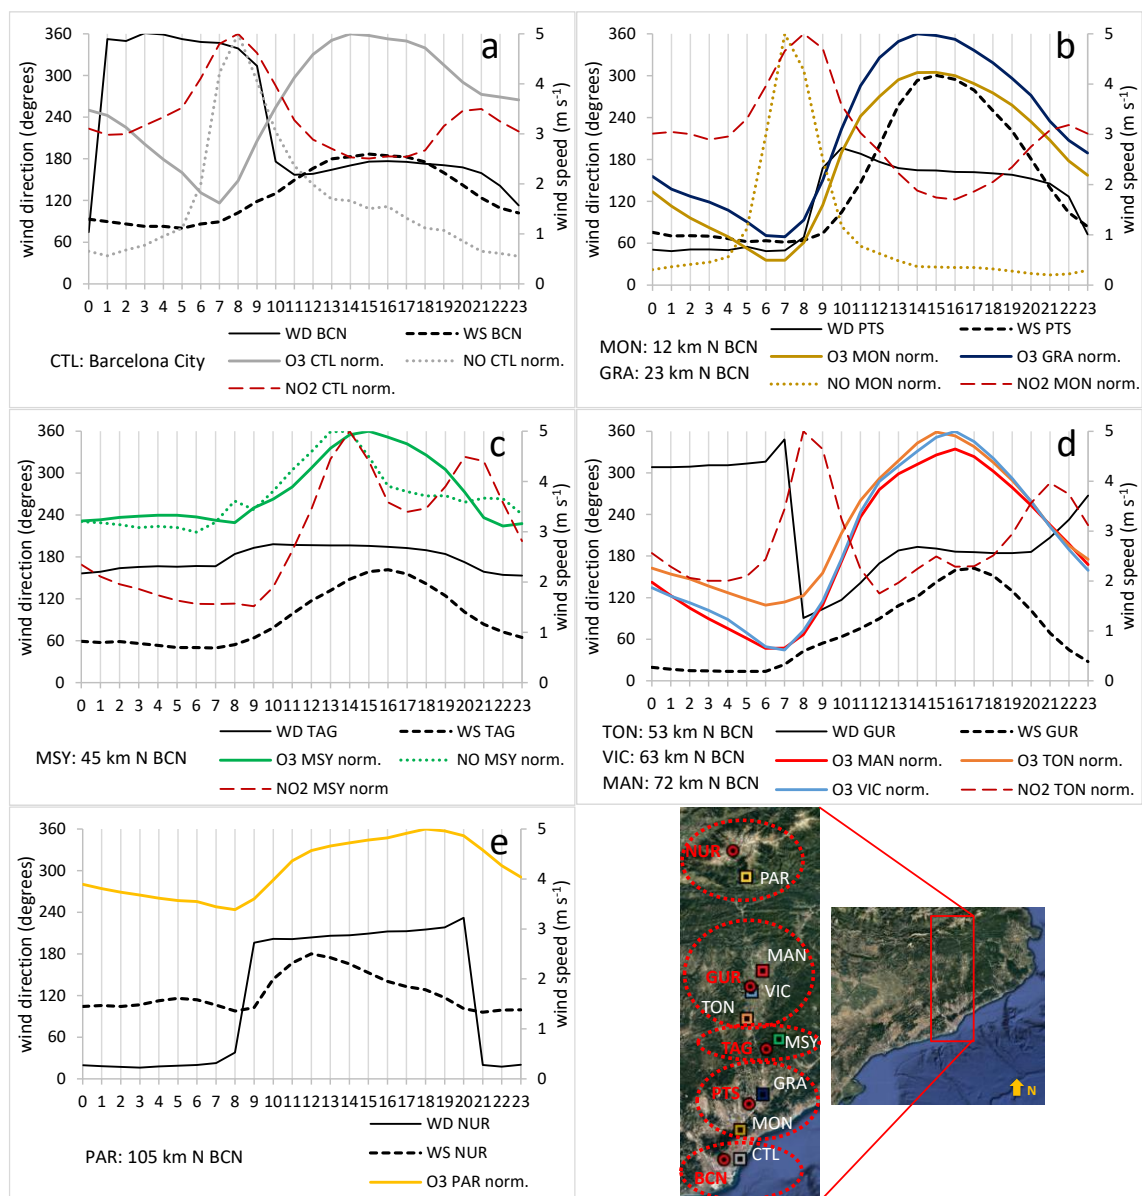

15

16 Figure S1. Selected regions for retrieval of OMI Tropospheric Column NO₂ in yellow: (a) area along the S–N
17 axis (~3,040 km²) which includes northern Barcelona Metropolitan Area (BMA), the Vic Plain and an area of
18 the Pre-Pyrenean range to analyze quantitatively the time trends and patterns and (b) across Western
19 Europe (~6,514 × 10⁶ km²) to analyze qualitatively the NO₂ spatial patterns in the two scenarios considered
20 (when the amount of O₃ in the Vic Plain is high and when it is low).

21

24 Figure S2. (a) Spatial variability of mean June–August NO (a) and NO₂ (b) concentrations observed in selected
25 AQ sites. Data from Ciutadella (CTL), Palau Reial (PLR), Montcada (MON), Granollers (GRA), Montseny (MSY),
26 Manlleu (MAN), Tona (TON), Montsec (MSC), Bellver de Cerdanya (BdC), Berga (BER), Mataró (MAT),
27 Manresa (MNR), Vilanova i la Geltrú (VGe), Constantí (CON) and Alcover (ALC) air quality monitoring stations.

29

30 Figure S3. Normalized O₃, NO and NO₂ cycles and wind patterns for July (wind coming direction in the left
 31 vertical axis and wind speed in the right vertical axis). Pollutants' concentrations (O₃, NO and NO₂) are
 32 normalized to the highest average value to emphasize the shape of the cycles, in the case of more than one
 33 O₃ cycle in a graph (b and d plots), the O₃ concentrations are normalized to the highest O₃ values of the site
 34 that measured them. July average wind speeds and directions data come from meteorological stations
 35 located near the corresponding AQ sites (air quality CTL monitoring site with meteorological BCN; air quality
 36 MON and GRA monitoring sites with meteorological PTS; air quality MSY monitoring site with meteorological
 37 TAG; air quality TON, VIC and MAN monitoring sites with meteorological GUR; air quality PAR monitoring site
 38 with meteorological NUR). The map shows the location of air quality monitoring sites (white codes; squares)
 39 and close meteorological sites (red codes; circles) grouped by pointed circles. Air quality data are from
 40 monitoring sites along the S-N axis. In general, the highest O₃ levels occur when the wind blows from the
 41 south (location of the Barcelona Metropolitan Area, BMA) at its maximum velocity, confirming the clear
 42 influence of the BMA plume transport.
