

Interactive comment on “Global inorganic nitrate production mechanisms: Comparison of a global model with nitrate isotope observations” by Becky Alexander et al.

Anonymous Referee #1

Received and published: 2 June 2019

The authors present an interesting analysis of oxygen isotopes in nitrate as a constraint on global chemistry. They consider the main processes, the role of a variety of interesting more minor ones and conclude that N_2O_5 and OH driven processes are about equal contributors to the global average nitrate source.

I recommend publication as is.
