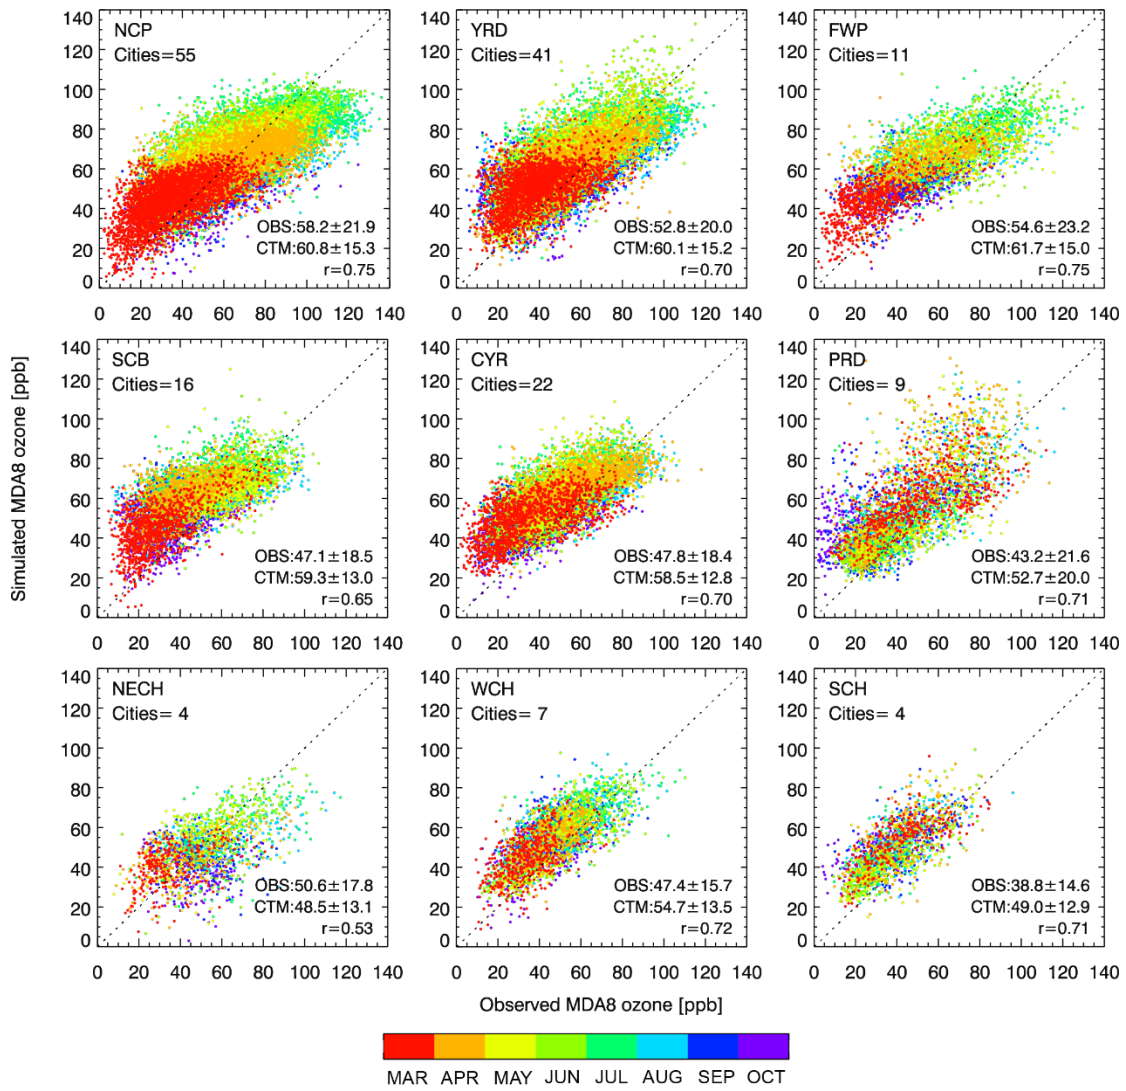
11 **Figure S1.** Spatial distribution of bimonthly mean (a) anthropogenic NO emissions, (b)

12 anthropogenic CO emissions, (c) anthropogenic NMVOC emissions averaged for 2016–2017.

13

14


15 **Figure S2.** Simulated vs. observed daily maximum 8 h average (MDA8) ozone concentrations at

16 the ensemble of the 169 cities categorized by the 9 city clusters for March-October 2016-2017. The

17 colors denote different months. The mean concentrations, standard deviations, correlation

18 coefficients (r), the 1:1 line, and number of cities in each city cluster are shown inset.

19

20

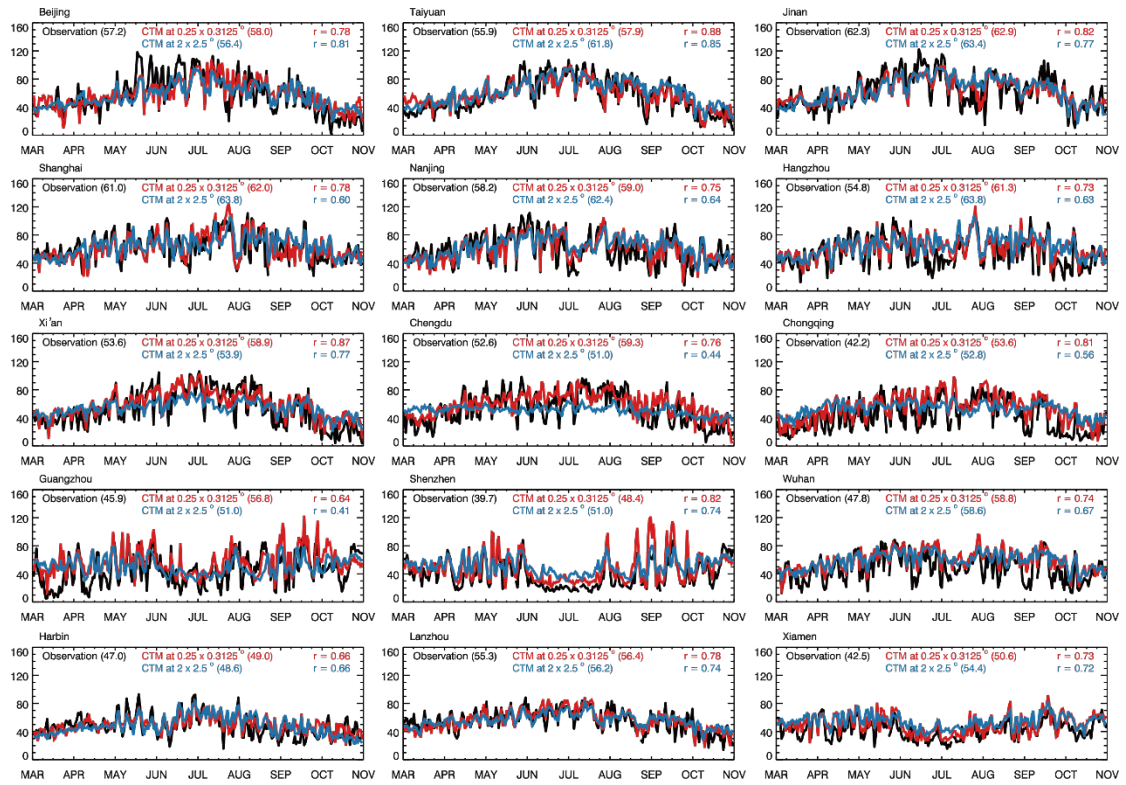
21


Figure. S3 Time series of observed and simulated daily MDA8 ozone concentrations from the nested model (red) and the global model (blue) at 15 representative cities from the nine city clusters in March-October 2017. The mean concentrations and correlation coefficients (r) are shown inset.

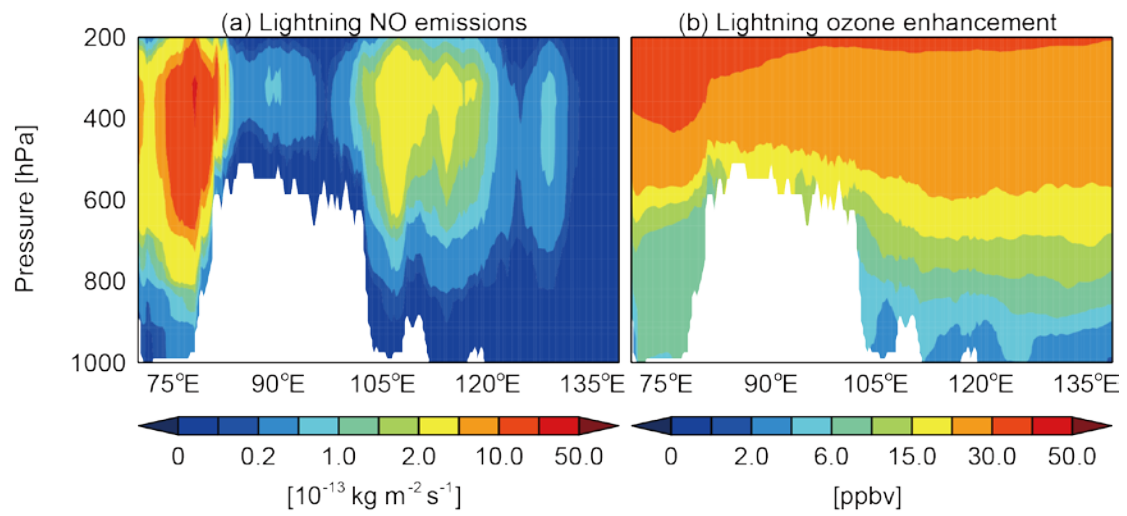
39


Figure S6. Zonal-vertical distribution of (a) lightning NO emissions and (b) lightning ozone
enhancement at 30°N。

42

43

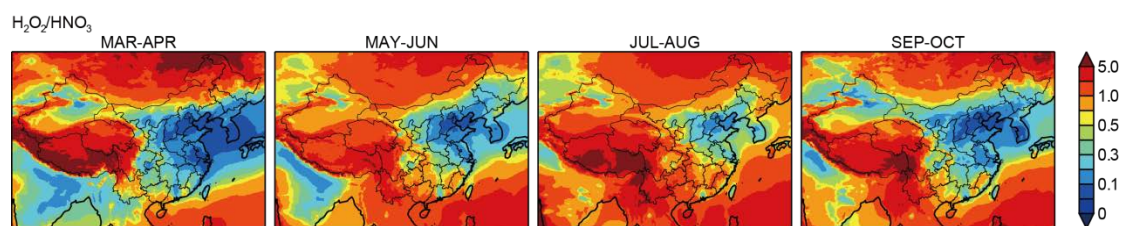
44


Figure S7. Spatial distribution of bimonthly mean H_2O_2/HNO_3 concentration ratios (an indicator of ozone chemical production regime) at the surface averaged for 2016–2017. Areas with H_2O_2/HNO_3 values lower than 0.3 can be considered as the VOC-limited regime, while values higher than 0.6 can be considered as NO_x-limited.
