Table S1: MDA8 ozone trends in China^a

Regions	JJA 2013–2019			JJA 2013–2017		
	OBS	MET	ANTH	OBS	MET	ANTH
China	1.9 (<i><0.01</i>) ^a	0.7 (<i><0.01</i>)	1.2 (<i><0.01</i>)	1.7 (<i><0.01</i>)	0.4 (<i>0.22</i>)	1.3 (<i><0.01</i>)
NCP	3.3 (<i><0.01</i>)	1.4 (<i>0.02</i>)	1.9 (<i><0.01</i>)	2.7 (<i>0.01</i>)	0.7 (<i>0.43</i>)	2.0 (<i><0.01</i>)
YRD	1.6 (<i><0.01</i>)	0.7 (<i>0.12</i>)	0.9 (<i><0.01</i>)	1.7 (<i>0.03</i>)	0.2 (<i>0.82</i>)	1.5 (<i><0.01</i>)
PRD	1.1 (<i>0.03</i>)	0.8 (<i>0.07</i>)	0.3 (<i>0.29</i>)	0.6 (<i>0.44</i>)	0.4 (<i>0.65</i>)	0.3 (<i>0.51</i>)
SCB	0.7 (<i>0.23</i>)	-0.2 (<i>0.59</i>)	1.0 (<i><0.01</i>)	0.9 (<i>0.42</i>)	0.1 (<i>0.90</i>)	0.8 (<i>0.20</i>)

^aObserved trends (OBS) are obtained by ordinary linear regression on summer (JJA) mean values of maximum daily 8-h average (MDA8) ozone measured at the sites of the Ministry of Ecology and Environment (MEE) network. The MDA8 ozone data are first averaged spatially over the $0.5^\circ \times 0.625^\circ$ MERRA-2 grid (Figure 2), and then averaged nationally (China) and over four megacity clusters: North China Plan (NCP), Yangtze River Delta (YRD), Pearl River Delta (PRD), Sichuan Basin (SCB). Meteorologically-driven trends (MET) are obtained by fitting the ozone data to a multiple linear regression (MLR) model, and the anthropogenically-driven trends (ANTH) are obtained from the residual. P-values for the trends are in italics; trends in bold are those with p-value smaller than 0.1.

Figure S1. Summer mean trends of 850 hPa wind vectors ($\text{m s}^{-1} \text{ a}^{-1}$) and surface daily maximum temperature ($^{\circ}\text{C a}^{-1}$, shaded) over the period 2013–2019. Data are from the MERRA-2 reanalysis.
