

Review of the Revision: Captured Cirrus Ice Particles in High Definition by Magee et al.

Overall impression and rating

Thank you for answering all my questions and concerns. The revised manuscript improved. I really like the new Section 2.5. "ICE-Ball upgrades in progress" and also thanks for putting the CFD calculation into the supplementary material, which is sufficient.

I still recommend to increase the size of the scale in Figure 4b and 4c, which is very hard to read and unreadable in a printed version.

I recommend publication in ACP after considering my last technical point.
