

Referee comments for “Effect of mixing structure on the water uptake of mixtures of ammonium sulfate and phthalic acid particles” (revised manuscript)

The revised manuscript shows significant improvements to the quality of the manuscript when compared to the original version. All referee comments are adequately assessed, and especially the uncertainty associated with the mixing state after humidification of the AS/PA particles is justified sufficiently with the added text in the manuscript and figures in SI material. The language of the paper is now also more fluent and better structured to fit the high standards of ACP. I recommend the publication of this paper in ACP as it is now.
