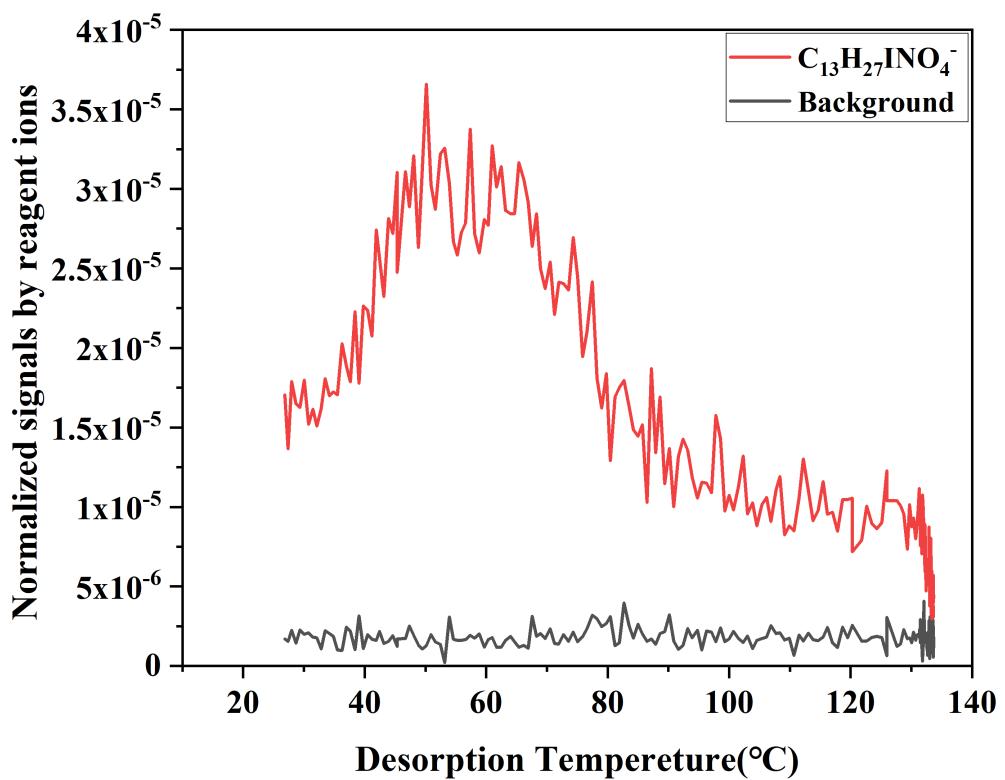

Figure S1. An example of the background signal of an identified compound, $\text{C}_{13}\text{H}_{27}\text{NO}_4\text{I}^-$.

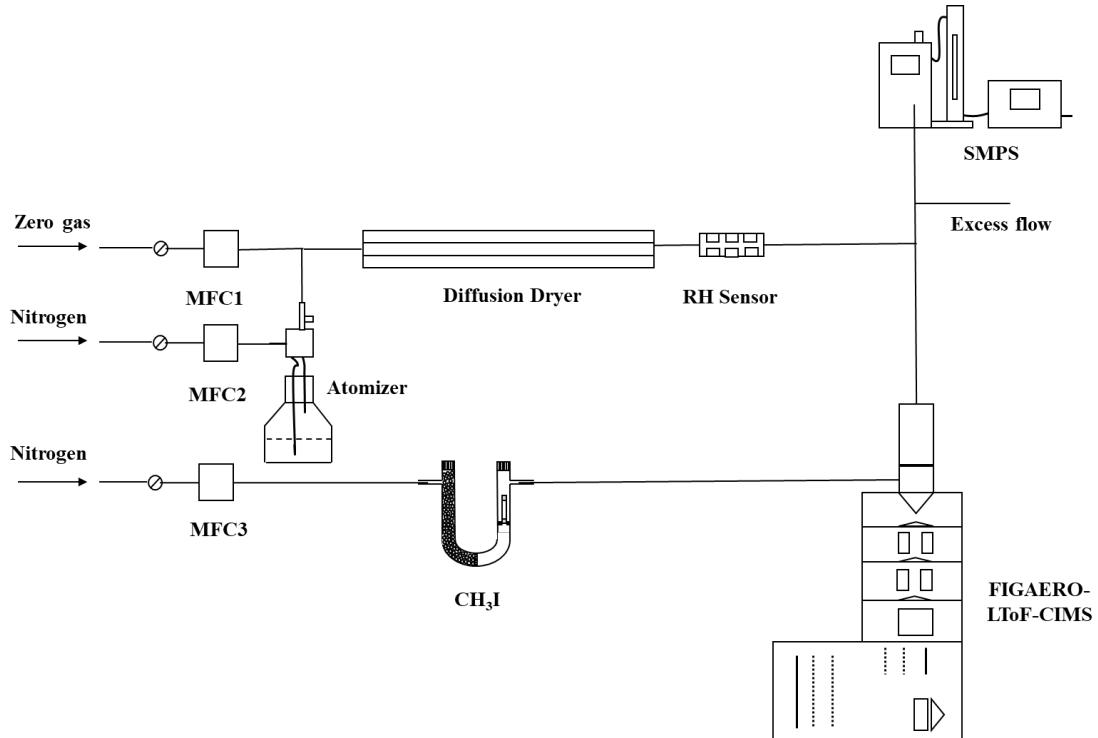

Figure S2. Schematics of the atomization method setup

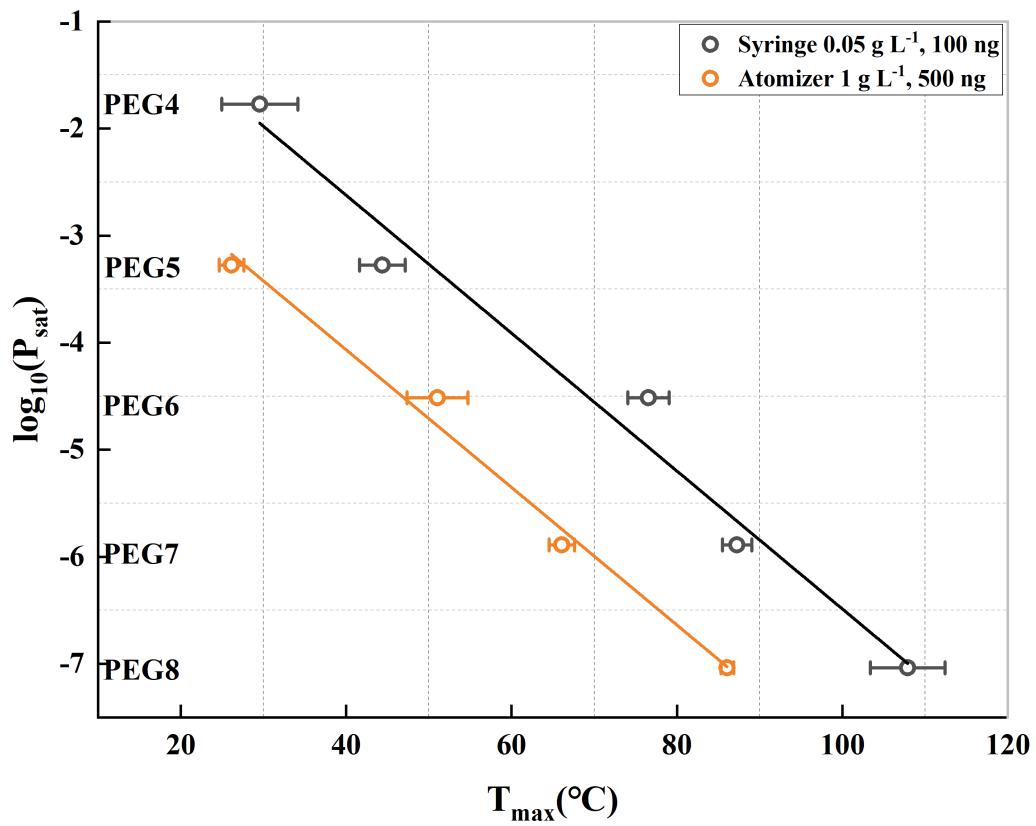

Figure S3 Comparison of T_{max} of different authentic organic standards between the syringe deposition method and the atomization method. Logarithm of literature-based P_{sat} are plotted against measured T_{max} for PEG compounds. Error bar represents \pm one standard deviation of T_{max} from four replicate experiments.

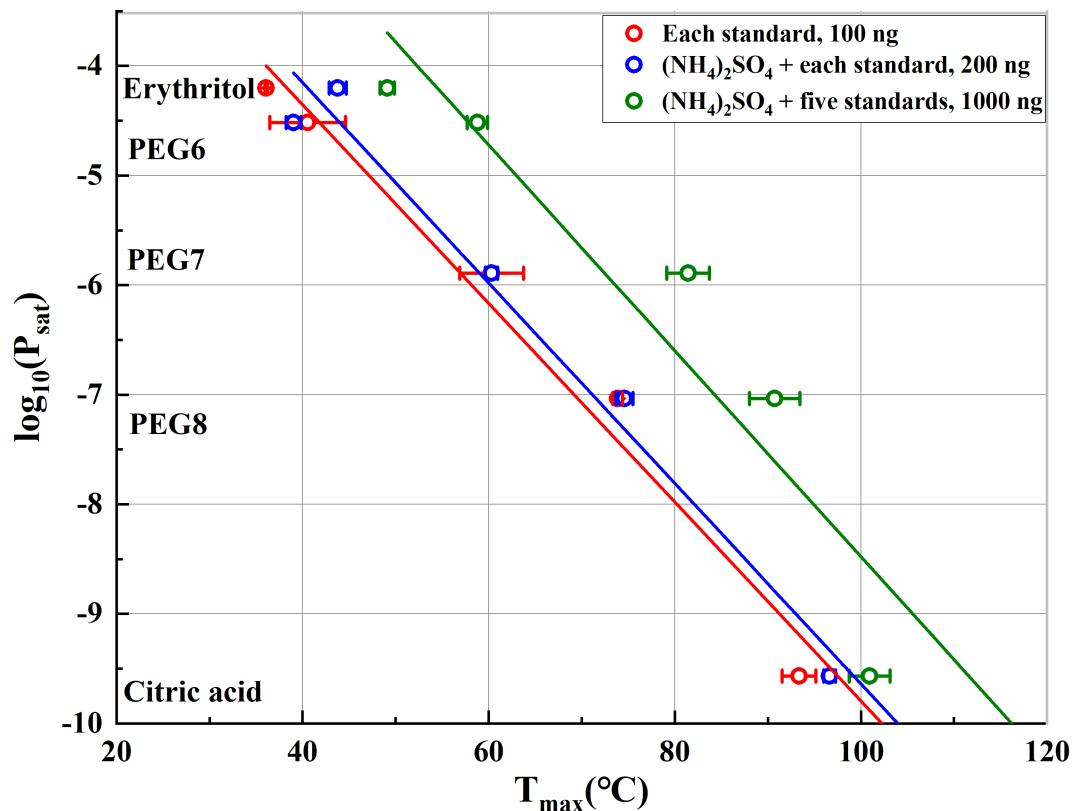

Figure S4. Influence of ammonium sulfate on T_{max} of organic standards. The red line denotes calibration results in the absence of ammonium sulfate, where the concentration of each standard solution was 0.5 g L^{-1} , and 100 ng dried particles for each standard were collected, respectively. The blue line denotes calibration results obtained by adding ammonium sulfate to each of the five organic standards solutions, where the concentrations of each standard and ammonium sulfate were 0.5 g L^{-1} , and 200 ng dried particles were collected, of which 100 ng each of ammonium sulfate and the organic standard. The green line denotes calibration results for the mixture of ammonium sulfate and five organic standards, where the concentration of each standard was 0.5 g L^{-1} , the concentration of ammonium sulfate was 2.5 g L^{-1} , and 1000 ng particles were collected. Error bar represents \pm one standard deviation of T_{max} from four replicate experiments.

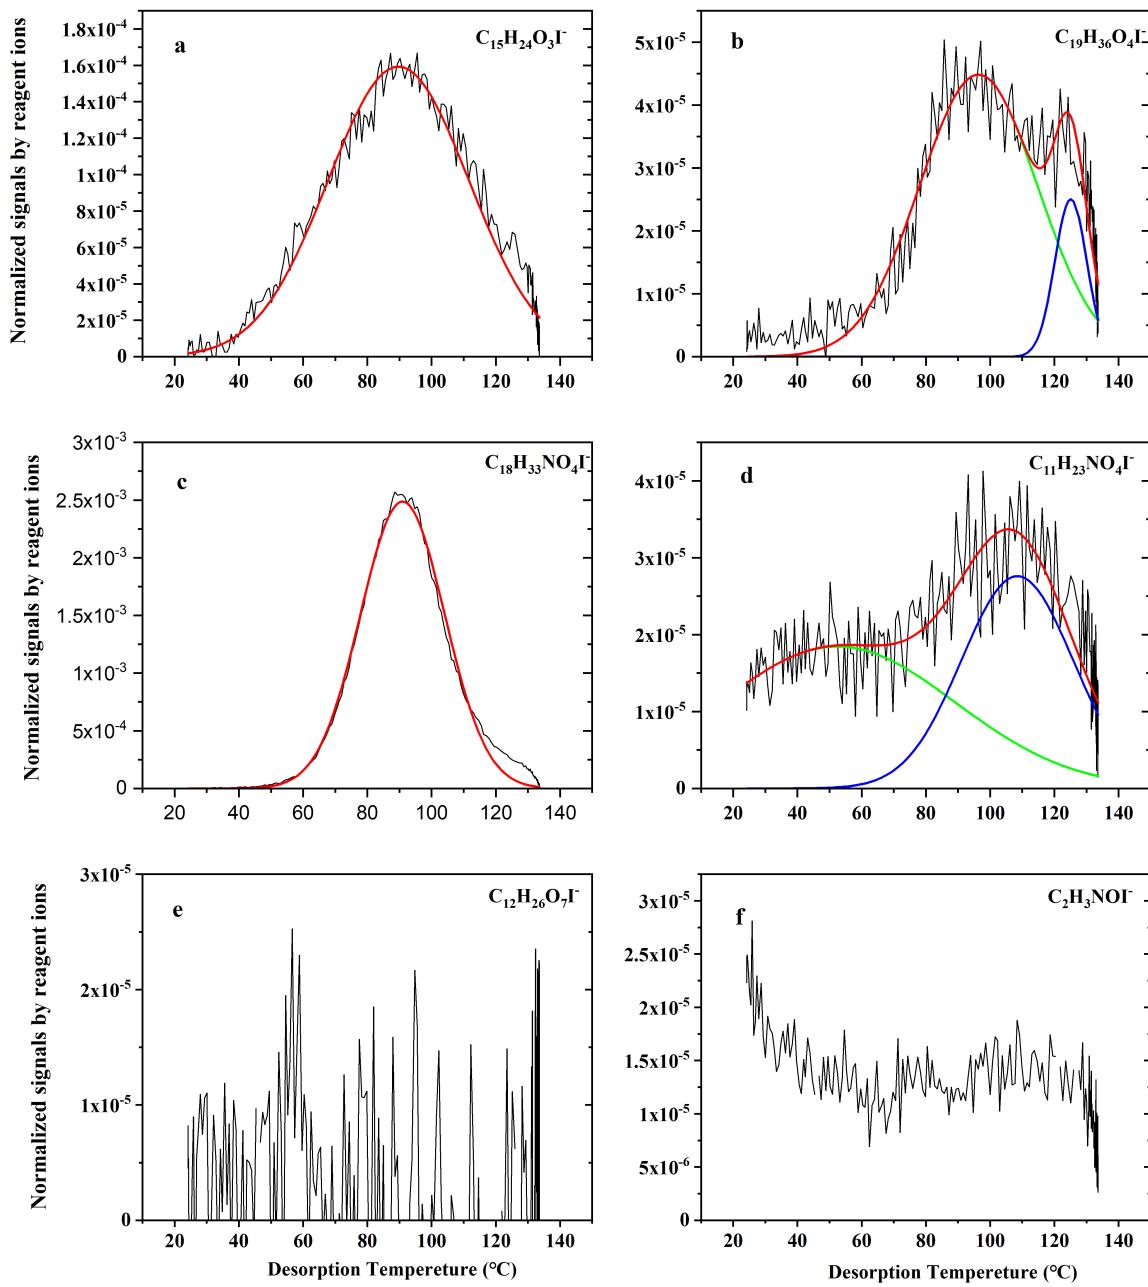

Figure S5. Four representative types of thermograms. Red, green and blue lines represent fitting curves for the overall thermogram, the first desorption peak, and the second desorption peak, respectively.

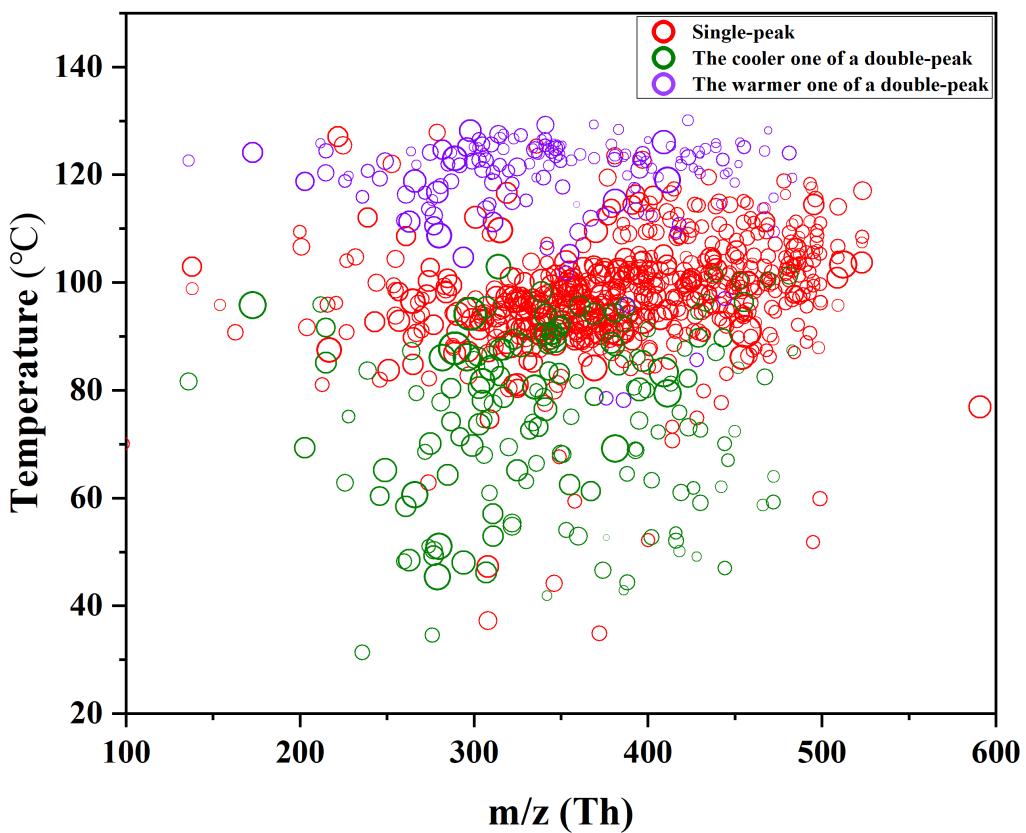

Figure S6. The peak temperatures of thermograms of 765 organic compounds. The reagent ion I^- was not removed from detected ions. The signal peaks, the cooler and warmer peaks of double-peaks are denoted by red, green and purple circles, respectively. The symbol size is proportional to the logarithm of the total signal.

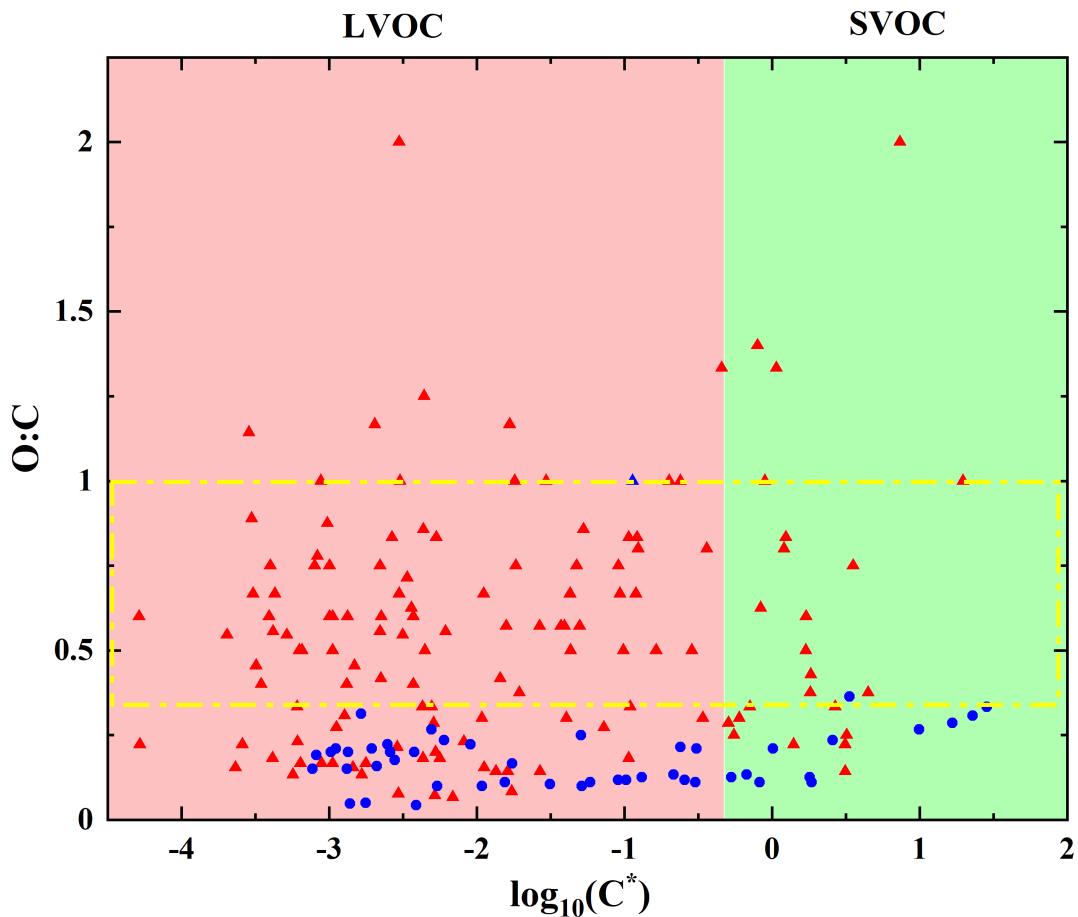

Figure S7. The 90 CHO and 91 CHNO species as displaced in 2-D space with volatility ($\log_{10}(C^*)$) versus oxygenation (O:C). Red triangles and blue circles denote the compounds in the red and blue dashed circles in Figure 4, respectively. The pink colored band denotes low-volatility organic compounds (LVOC), and the green colored band denotes semi-volatility organic compounds (SVOC).

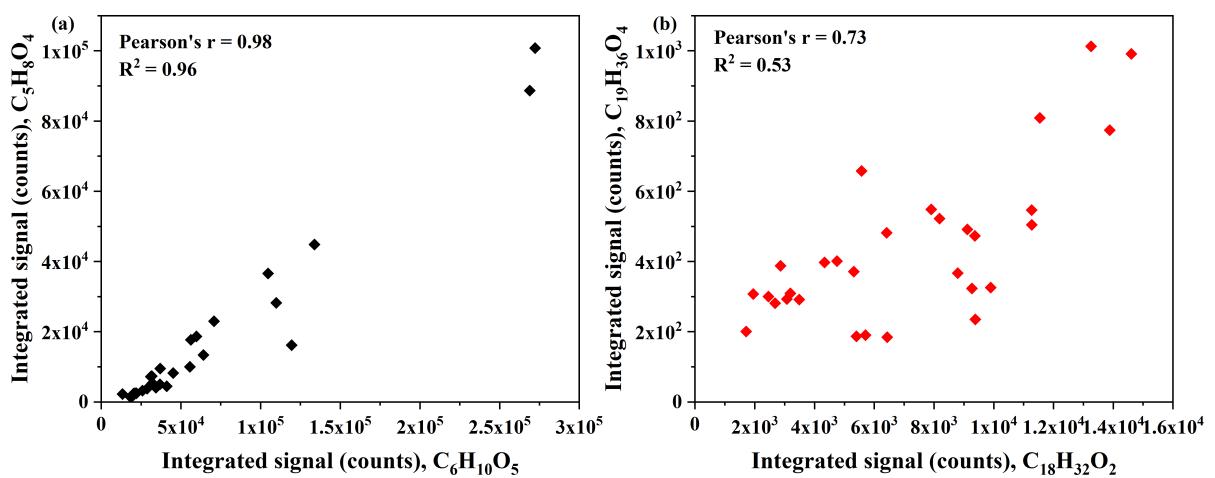

Figure S8. (a) An example of the correlation of $C_6H_{10}O_5$ and $C_5H_8O_4$ in the red dashed circle of Figure 4 in main text, (b) An example of the correlation of $C_{18}H_{32}O_2$ and $C_{19}H_{36}O_4$ in the blue dashed circle of Figure 4 in main text.

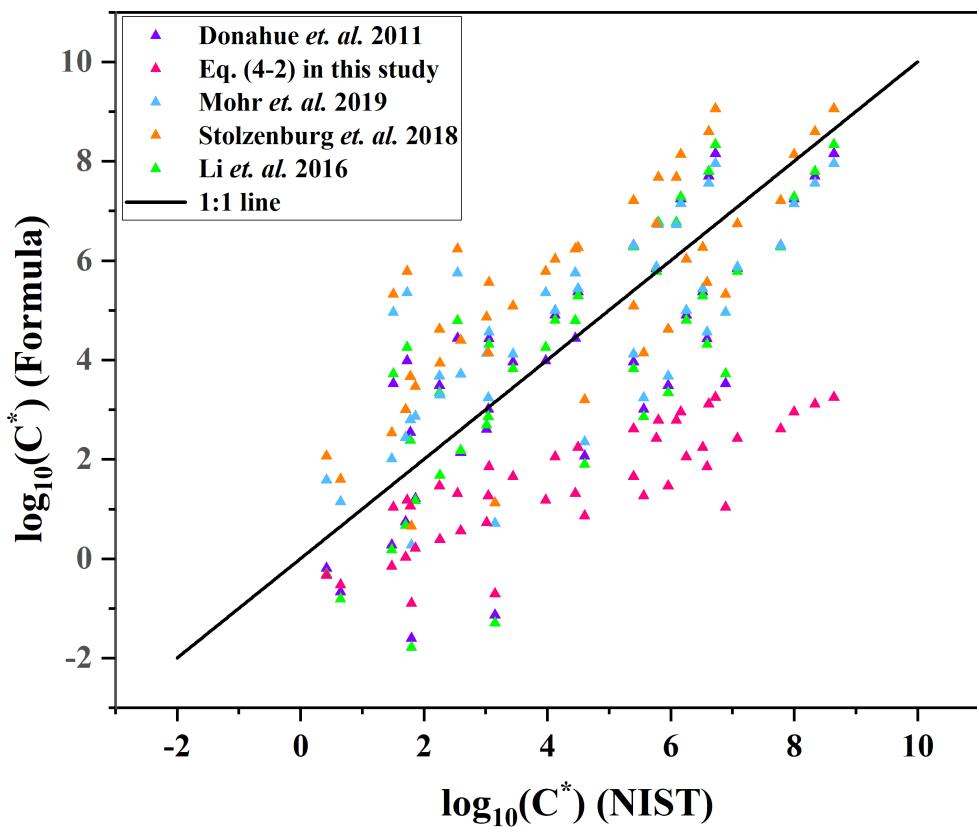

Figure S9. Saturation mass concentration (C^*) of 42 alcohols, aldehydes, acids and diols with O/C from 0 to 0.25 estimated by Eq. (4-2) in this study, and parametrizations from Donahue et al. (2011), Mohr et al. (2019), Stolzenburg et al. (2018), and Li et al. (2016), respectively, against that from NIST.
