**310.5 - 326 nm**

**SO<sub>2</sub> VCD (DU) 03 August 2019**

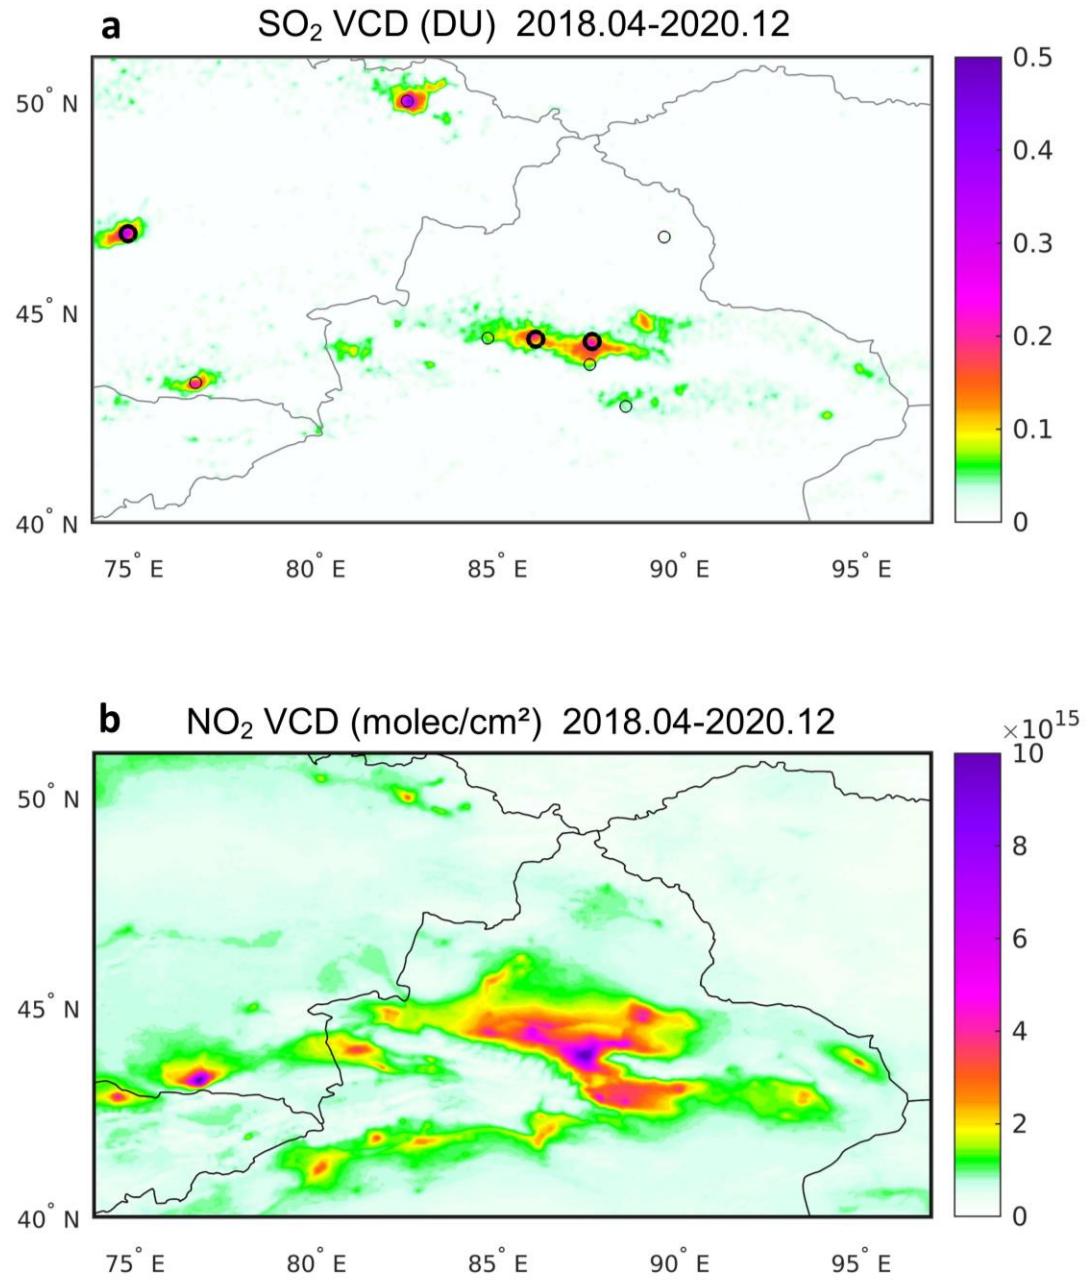

1

2 Figure S1. SO<sub>2</sub> vertical columns retrieved from TROPOMI measurements over Asia on 03 August  
3 2019 by the COBRA using wavelength ranges: (top) 312-326 nm and (bottom) 310.5-326 nm. All  
4 satellite pixels (for all rows) are used in the maps; a fixed AMF of 0.4 is applied for the SCD to  
5 VCD conversion.

1

2 Figure S2. Comparison of  $\text{SO}_2$  columns from TROPOMI COBRA and DOAS retrievals for  
3 October 15, 2019. Only the pixels with unambiguous detection of  $\text{SO}_2$  were selected, based on the  
4  $\text{SO}_2$  detection flag from the operational product. The correlation coefficient and slope of the  
5 regression line are given as an inset.

1  
2 Figure S3. (a) SO<sub>2</sub> vertical columns retrieved by COBRA for TROPOMI measurements from April  
3 2018 to December 2020, over a region covering north Xinjiang province (China), east Kazakhstan,  
4 and parts of Kyrgyzstan and Mongolia. Black circles indicate SO<sub>2</sub> sources (coal power plants and  
5 smelters) detected by OMI (in bold for the 2018-2019 period, see text). (b) same as (a) for the  
6 tropospheric NO<sub>2</sub> vertical columns from TROPOMI operational product (OFL and RPRO  
7 combined).

1    **Supplementary file:**

2    The global SO<sub>2</sub> vertical column map discussed in section 4 is included as supplement in the form  
3    of a geotiff file (S5P\_COBRA\_SO2\_VCD\_2018\_04\_2020\_12.tif), compatible with Google Earth  
4    viewer. The data is a long-term average of SO<sub>2</sub> columns over the period of April 2018 to December  
5    2020, for the latitudinal band 51°S-72°N. The SO<sub>2</sub> vertical column is in Dobson Unit and  
6    represented with the color scale below.
