## 1. Lifetimes of HONO and NO<sub>x</sub> and direct HONO emissions (HONO<sub>emi</sub>)

As discussed in the main text (Section 3.2.2.1), the contribution of direct emission on the observed HONO could be overestimated when using a constant  $\Delta\text{HONO}/\Delta\text{NO}_x$ , especially during the daytime due to the distinctly different lifetimes of HONO ( $\tau(\text{HONO})$ ) and NO<sub>x</sub> ( $\tau(\text{NO}_x)$ ). Therefore, during the daytime, when  $\tau(\text{HONO})$  was shorter than 1 h, HONO<sub>emi</sub> was corrected by multiplying the ratio of  $\tau(\text{HONO})/\tau(\text{NO}_x)$  (see (Eq-3) in the main text).  $\tau(\text{HONO})$  against OH and photolysis was directly obtained from F0AM model simulations (Wolfe et al., 2016).  $\tau(\text{NO}_x)$  depends NO<sub>2</sub> lifetime and NO/NO<sub>2</sub> ratio regarding the net loss of NO<sub>x</sub> is mainly in the form of HNO<sub>3</sub> produced through OH or NO<sub>3</sub> induced reactions. The equation is shown in (Eq-S1) (Seinfeld and Pandis, 2016).

$$\tau(\text{NO}_x) = \tau(\text{NO}_2) * (1 + \frac{\text{NO}}{\text{NO}_2}), \quad (\text{Eq-S1})$$

Net NO<sub>2</sub> loss was through reactions of  $\text{NO}_2 + \text{OH} \rightarrow \text{HNO}_3$ ,  $\text{NO}_3 + \text{VOCs} \rightarrow \text{HNO}_3$ , and  $\text{NO}_3 + \text{NO}_2 + \text{wet surface} \rightarrow \text{HNO}_3$ , which were considered to calculate  $\tau(\text{NO}_2)$ . Results on HNO<sub>3</sub> production rate were presented in Figure 12 and discussed in Section 3.3.3.1 of the main text. Results on daytime  $\tau(\text{HONO})$ ,  $\tau(\text{NO}_x)$ , and HONO<sub>emi</sub> were shown in Figure S6.

Figure S1: Correlation between the measured  $J(\text{NO}_2)$  and solar irradiance (Ra).

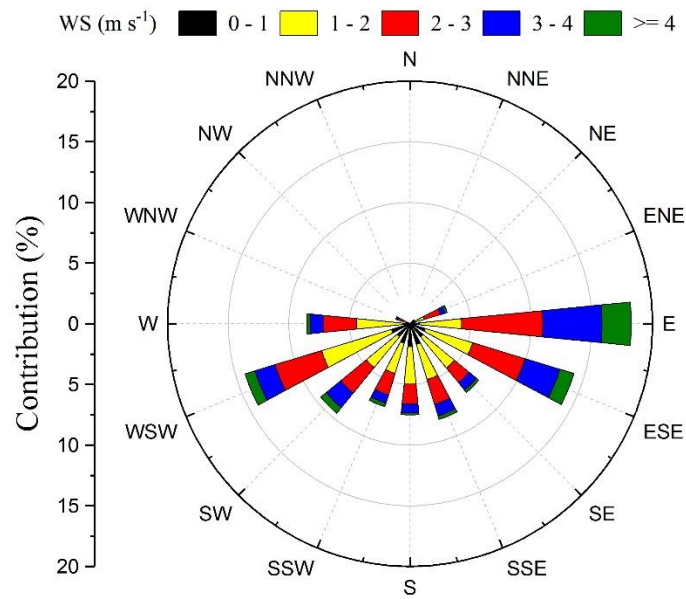

Figure S2: Wind rose plot for the wind measurements at the foot of Mt. Tai

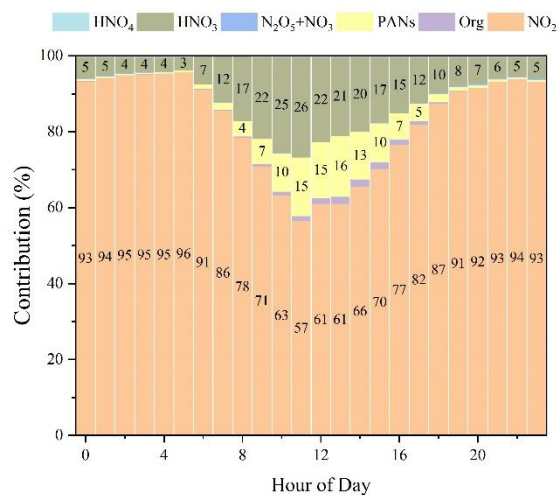

Figure S3: Relative contribution of each NO<sub>z</sub>\* species. PANs = PAN + PPN + MPAN, and Org represents organic nitrates\*.

Figure S4: Diurnal variations of HONO and HNO<sub>4</sub> and their correlations.

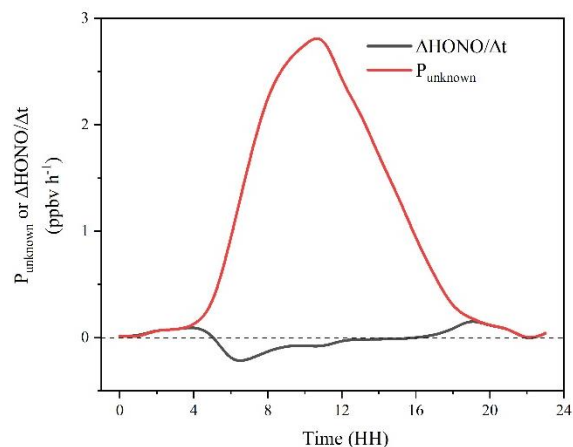

Figure S5: Diurnal variations of  $P_{\text{unknown}}$  and  $\Delta\text{HONO}/\Delta t$ .

80 Figure S6: (A): Daytime lifetimes of HONO and NO<sub>x</sub>; (B): HONO<sub>emi</sub> with a constant  $\Delta\text{HONO}/\Delta\text{NO}_x$  ratios (Normal) or modified according to lifetimes (Modified) and the contribution of modified HONO<sub>emi</sub> to the observed HONO.

**Figure S7: Modeled (Sce-3 with reduced  $\gamma_g$  and enlarged  $\gamma_a$  of  $1.2 \times 10^{-3}$ ) HONO mixing ratios (Model, in blue) in comparison with observations (Obs, in black). (A): time series; (B): diurnal variations.**

**Figure S8: Modeled (Sce-3 with reduced  $\gamma_g$  and enlarged EF of 400) HONO mixing ratios (Model, in blue) in comparison with observations (Obs, in black). (A): time series; (B): diurnal variations.**

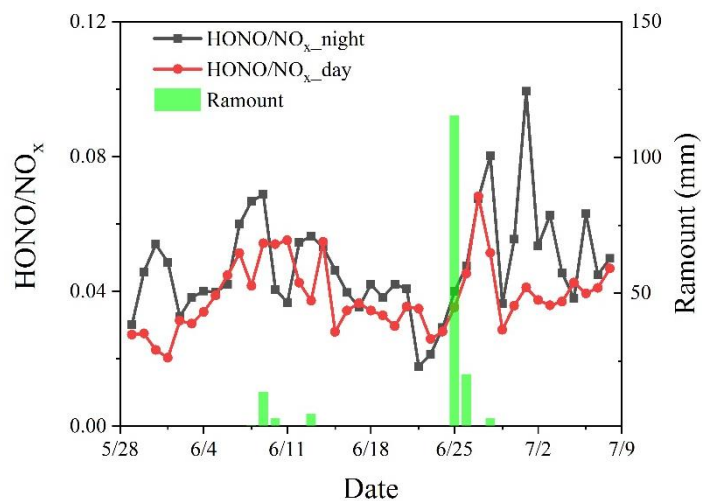

Figure S9: Daily rainfall amount (Ramount) and the daytime or the night-time HONO/NO<sub>x</sub>.

90

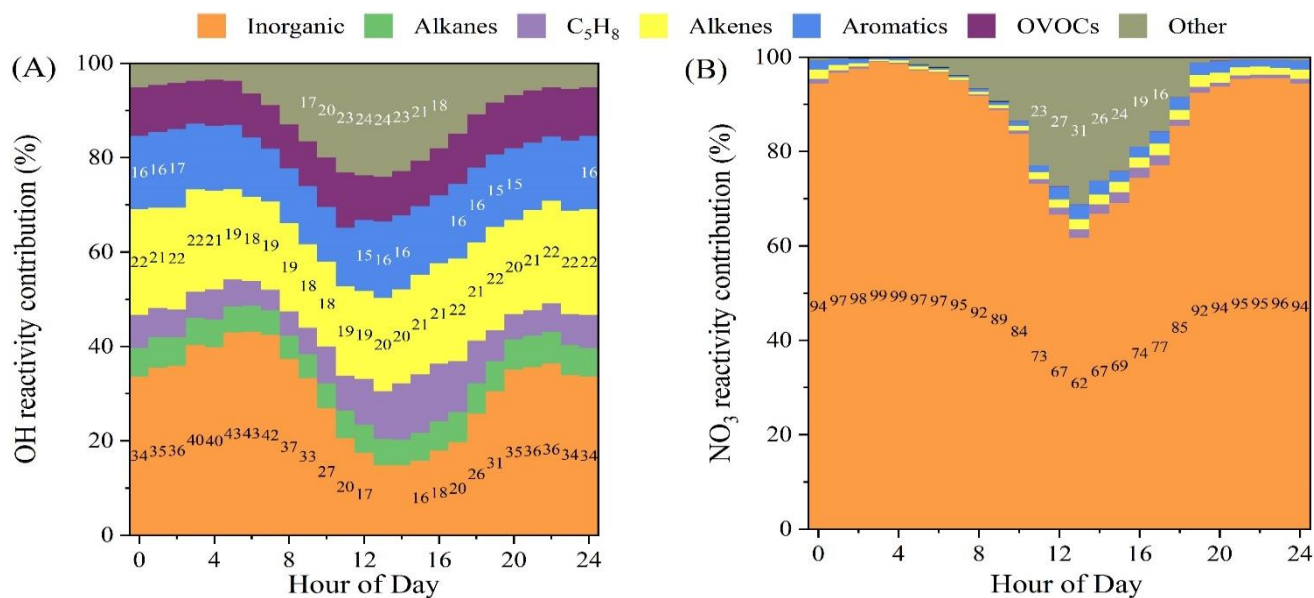

Figure S10: (A): OH and (B): NO<sub>3</sub> reactivity contributions. Reactivity with other unmeasured species was classified as “other”. Note that alkenes here do not include C<sub>5</sub>H<sub>8</sub>.

95

**Figure S11: Relative contributions of different primary RO<sub>x</sub> paths (A): throughout the whole day or (B): during the daytime.**
