

Review of the revised version of the paper:

“Age Spectra and Other Transport Diagnostics in the North American Monsoon UTLS from SEACRS In Situ Trace Gas Measurements”

written by Ray et al.

General:

I like the revised version very much. I have only few optional minor points

Minor points:

- L185
I would replace wording “concentrations” by “mixing ratios”. This is what you need in the following
- L360
After point 5 I would expect something like: By varying K and the source coordinates y_{pTR} and y_{pNA} , the best fit of the tropical and NA spectra will be determined.
