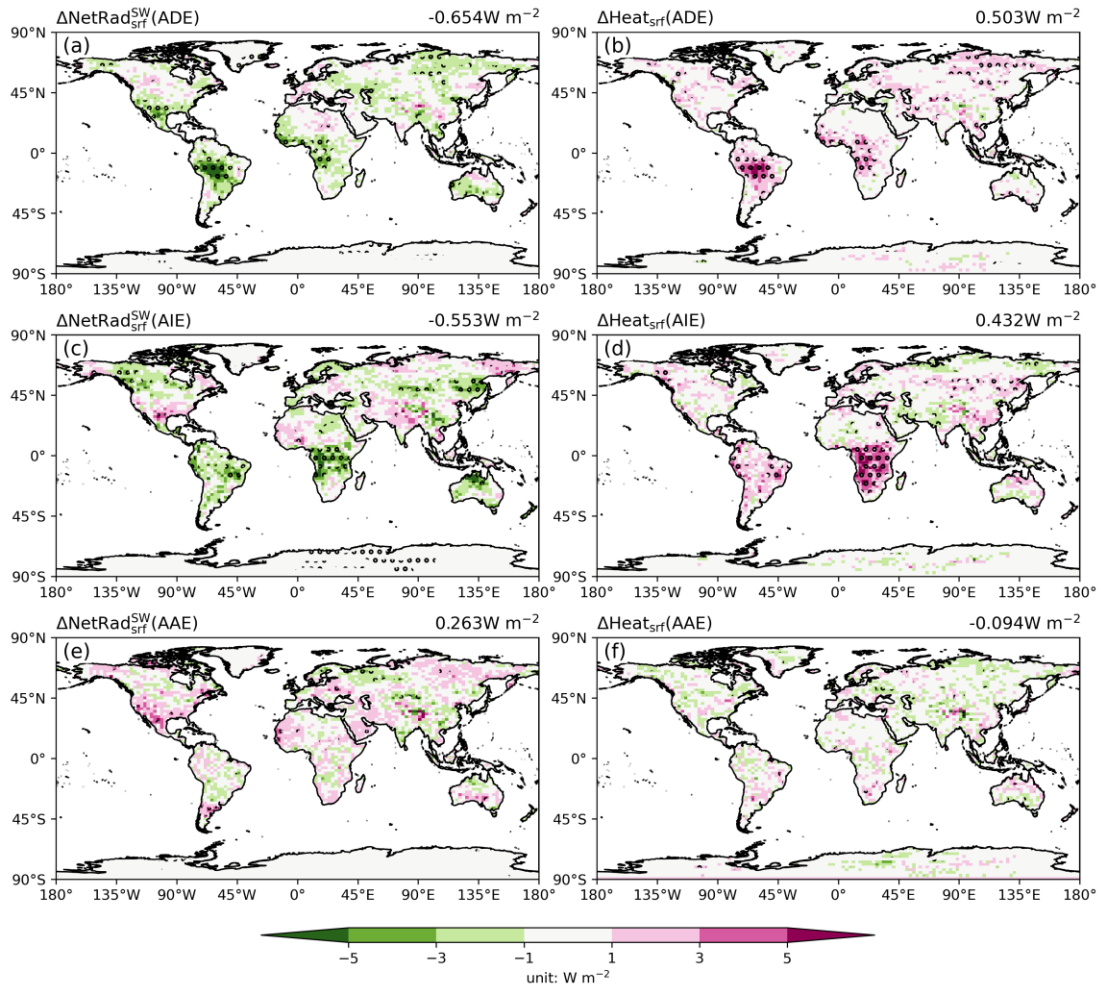

Fig. S1 Annual mean fire emissions of (left) BC and (right) OC (a, b) simulated by ModelE2-YIBs and (c, d) observed from GFED4.1s. Modeling results are from the simulation of YF_AD_AI_AA. The total emissions are shown on the bottom right of each panel. The correlation coefficients and normalized mean biases between simulations and observations are shown on the top panels.

24

25 **Fig. S2** Annual mean changes in AOD at 550 nm induced by fire.

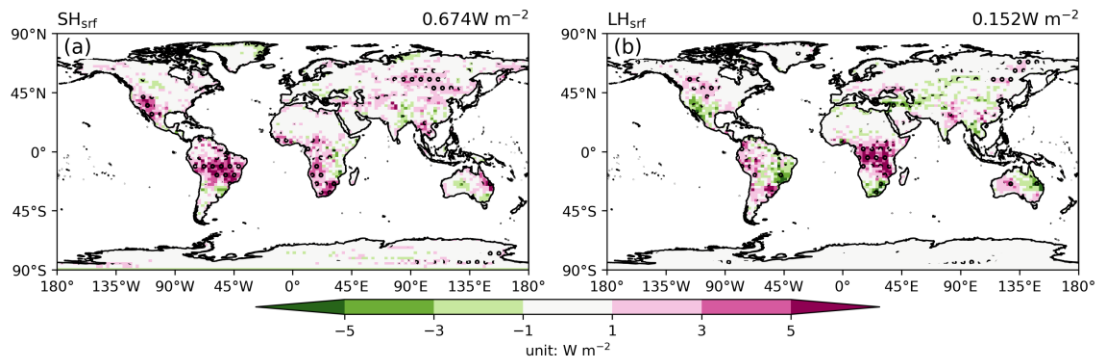

26

27

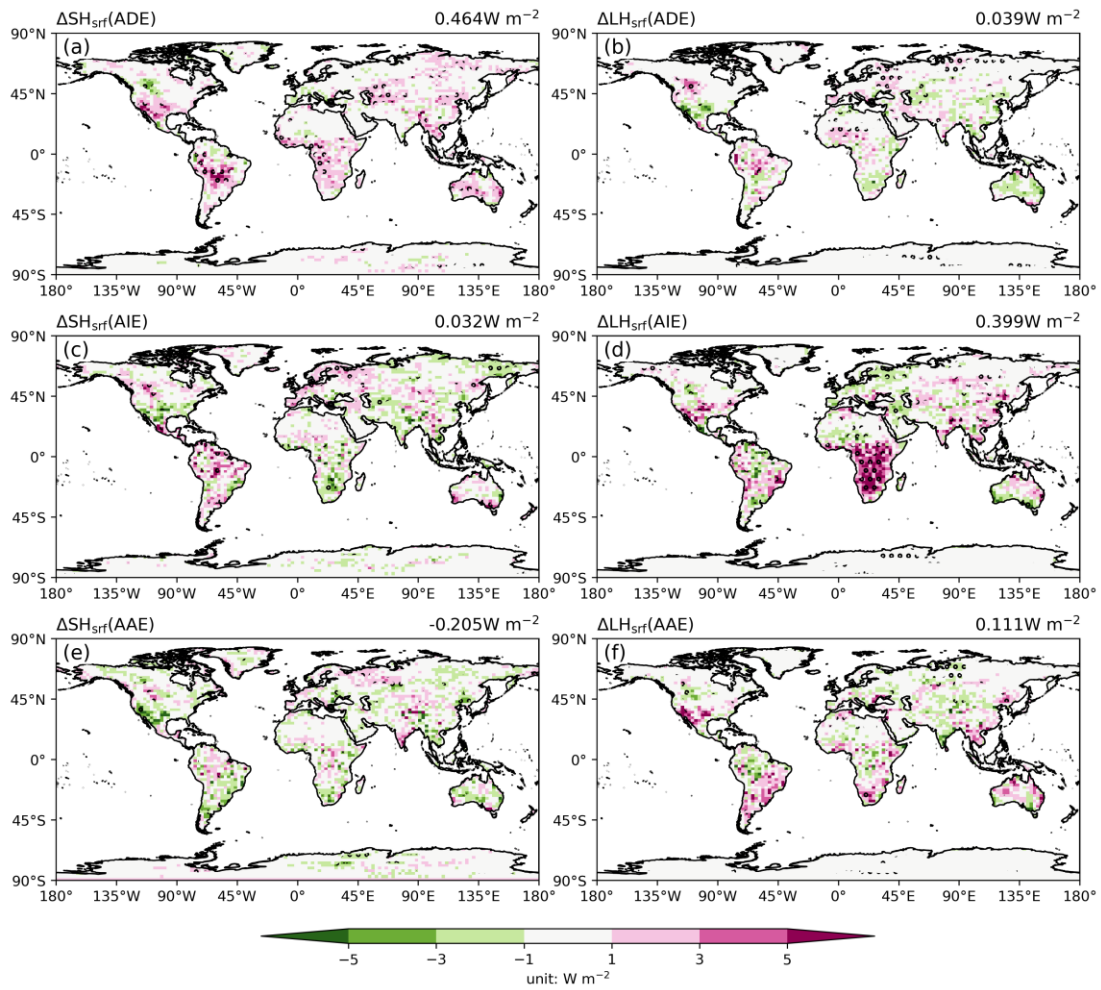

28 **Fig. S3** Changes in surface (left) net shortwave and (right) heat fluxes (sensible + latent) due to (top)
 29 direct effects, (middle) indirect effects, and (bottom) BC-snow feedback of fire aerosols over land
 30 grids. Positive values represent the increase of downward radiation. Global land average is shown
 31 at the top of each panel. Dots denote areas with significant ($p < 0.1$) changes.
