15 **Table S2. Aircraft measurement programs used for inversion model evaluation.**

Measurement program code	Measurement program name	DOI	Reference
ABOVE	Arctic-Boreal Vulnerability Experiment	10.3334/ORNLDAAC/1658	Sweeney and McKain (2019)
ACT	Atmospheric Carbon and Transport-America	10.3334/ORNLDAAC/1593	Davis et al. (2018)
TOM	ATom, Atmospheric Tomography Mission	10.3334/ORNLDAAC/1732	McKain and Sweeney (2021)

20 **Figure S1: Spatial and seasonal distributions of RMSE for the modeled XCO₂ against the OCO-2 XCO₂ between 2015 and 2020.** The modeled XCO₂ are derived from the GEOS-Chem model simulation driven by the posterior fluxes of our reference inversion. The RMSE is calculated and present for March–May (a), June–August (b), September–November (c), and December–February (d). The values shown here are the annual averages between 2015 and 2020.

25 **Figure S2: Comparisons of the GEOS-Chem modeled XCO_2 with OCO-2 XCO_2 at the daily scale between 2015 and 2020.** The GEOS-Chem simulations driven by the prior (blue curves) and the posterior (red curves) fluxes of our reference inversion are evaluated against the OCO-2 XCO_2 retrievals (black curves) over the Northern Hemisphere (a) and the Southern Hemisphere (b), respectively.

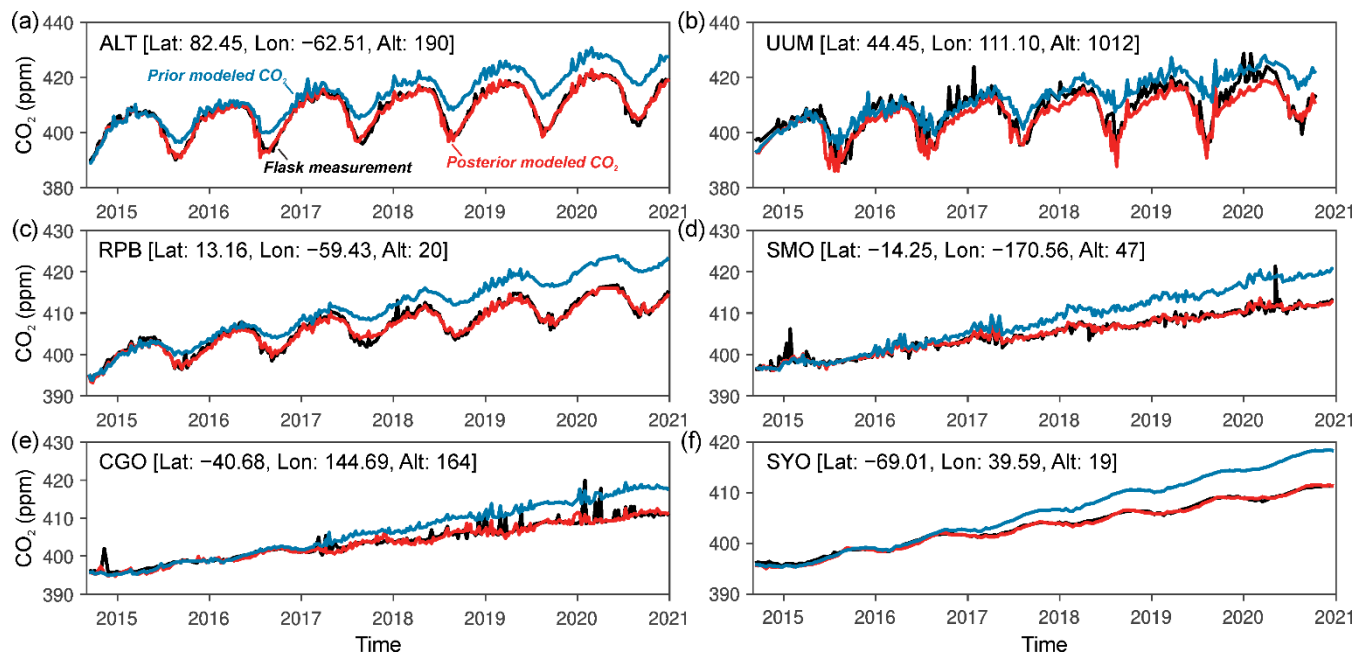

Figure S3: Comparisons of the GEOS-Chem modeled CO₂ concentrations with surface flask measurement at the daily scale between 2015 and 2020. The GEOS-Chem simulations driven by the prior (blue curves) and the posterior (red curves) fluxes of our reference inversion are evaluated against the flask measurement (black curves) from the surface stations of ALT (a), UUM (b), RPB (c), SMO (d), CGO (e), and SYO (f), which vary by latitude and by altitude and have continuous measurement records since 2014.

30

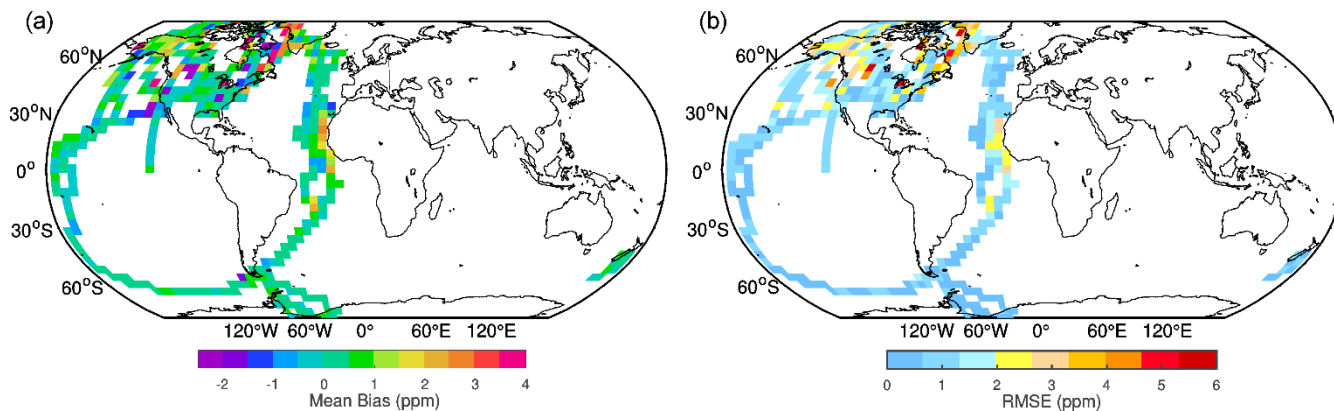

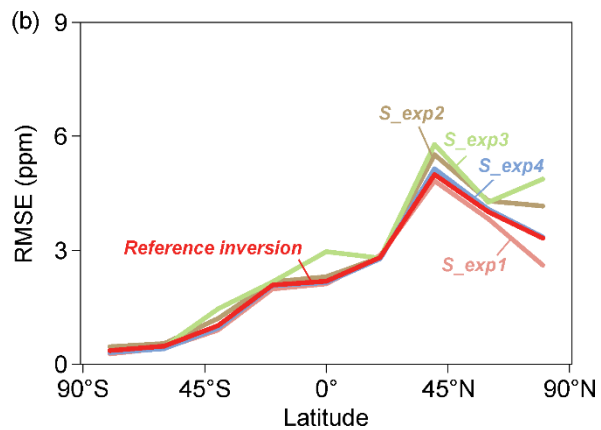

Figure S4: Mean bias and RMSE for the GEOS-Chem modeled CO₂ concentrations against aircraft measurement. The GEOS-Chem simulations driven by the posterior fluxes of our reference inversion are evaluated against the aircraft observations above 3000 m with biases (a) and RMSEs (b) shown in the GEOS-Chem 4° × 5° grid cells. The aircraft measurement programs are shown in Table S2.

35

Figure S5: Comparisons of the GEOS-Chem modeled dry air mole fractions of CO₂ with surface measurements for 2015. The simulations driven by posterior fluxes from our reference inversion and four sensitivity inversions in 2015 are evaluated against surface flask observations for modeled biases (a) and RMSEs (b). The measurement sites are summarized in Table S1.
