

**Supplementary Information for  
The underappreciated role of transboundary pollution in future air quality and health  
improvements in China**

This Supplemental Information document presents the additional data to support the primary document.

**Figure S1.** Future emissions of PM<sub>2.5</sub>-related pollutants in China and in other countries. **(a)** Emissions for foreign countries within our Flex-Grid simulation domain (11° S–60° N, 30°–150° E) for future years are projected under SSP-RCP scenarios, with updates on base year emissions and the harmonization year in this study. Colors represent the emissions of different pollutants following the legend. **(b)** Emissions for China for future years are projected with the current-policy scenario and the carbon-neutral scenario.

**Figure S2.** Correction and evaluation of simulated  $PM_{2.5}$  over China. **(a)** Comparison of the observed and unscaled simulated annual mean concentrations  $PM_{2.5}$  at collocated grids for 2015. Both the observed and the simulated  $PM_{2.5}$  were in grids where anthropogenic  $PM_{2.5}$  exceeds natural  $PM_{2.5}$ .  $r$  refers to the correlation coefficient. NMB refers to normalized mean bias.  $N$  indicates the number of grids shown in the figure. **(b)** Same as (a), but for scaled simulated  $PM_{2.5}$  concentrations to remove the systematic bias. **(c)** Same as (a), but for all grids (including both anthropogenic pollution-dominated and natural pollution-dominated grids). **(d)** Same as (b), but for all grids.

**Figure S3.** Future population and age structure in China. Total populations in China in 2015 and future years projected under different SSP scenarios (SSP1 corresponds to China’s carbon-neutral scenario; SSP2 corresponds to China’s current-policy scenario). Colors represent different age groups according to the legend. White numbers indicate the fraction of population above the age of 65 in the total population.
